Lantronix shall have no liability whatsoever to any user for any damages, losses and causes of action (whether in contract or in tort or otherwise) in connection with the user's access or usage of any of the information or content contained herein. The information and specifications contained in this document are subject to change without notice.

Revision History

Date	Rev.	Description
06/15/15	F	Update C3220 / C3221 port labeling, Well Known ports, Switch Mode (Local / Re- mote), configuring VLAN Mode, and DHCP default mode information.
07/27/15	G	Add S3221-1040-T information.
8/28/23	Н	SW v 1.3.26: add RMPS (Remote Manage Power Supply) feature, Local Manage- ment of Cards in a Remote Un-managed Chassis, and DMI Vendor Specific Infor- mation. Fix calculations for ingress bandwidth limiting rates and fix backup and re- store issue when the device is set to Local Management mode via a unique IP address. Update ssh server, link state now reflects admin state, improve Local and Remote backup in stand-alone modules. Initial Lantronix rebrand. Update contact information, remove Converge EMS, Glossary, and Index. See the Release Notes for more information.

General

This manual describes the USB and Telnet command line interface (CLI) commands available for ION System chassis or standalone operation of the ION x222x / x32xx Multiport NID. This manual is for experienced network administrators who are responsible for configuring and maintaining the ION system.

CLI offers the most comprehensive set of management features. CLI is used during the initial setup (set IPs, etc.) and troubleshooting, but can also be used for day-to-day management (device management, firmware upgrades, managing security features, etc.).

This manual documents the following models:

C2220 LOAM/IP-Based Remotely-Managed NID C3220 LOAM/IP-Based Remotely-Managed NID C3221 LOAM/IP-Based Remotely-Managed NID (2 open SFP slots)* S2220 LOAM/IP-Based Remotely-Managed NID S3220 LOAM/IP-Based Remotely-Managed NID S3221 LOAM/IP-Based Remotely-Managed NID (2 open SFP slots)* S3221-1040-T LOAM/IP-Based Remotely-Managed Hardened NID. For Extended Temp (-40 C to +65C; use PS PN 25138)

Models shown with an asterisk (*) are available in a model with an open SFP port.

CLI commands are case sensitive. Enter the CLI commands as shown in this document.

In order to execute the commands described in this manual, you must press the **Enter** key after the command has been entered.

Documentation Conventions

The conventions used within this manual for commands/input entries are described in the table below.

Convention	Meaning
Boldface text	Indicates the entry must be made as shown. For example: ipaddr= <addr> In the above, only ipaddr= must be entered exactly as you see it, including the equal sign (=).</addr>
<>	Arrow brackets indicate a value that must be supplied by you. Do not enter the symbols < >. For example: ipaddr= <addr> In place of <addr> you must enter a valid IP address.</addr></addr>
[]	Indicates an optional keyword or parameter. For example: go [s = <xx>] In the above, go must be entered, but s= does not have to be.</xx>
{}	Indicates that a choice must be made between the items shown in the braces. The choices are separated by the symbol. For example: state={enable disable} Enter state=enable or state=disable.
	Indicates that the parameter must be entered in quotes. For example: time= <"value"> Enter time= "20100115 13:15:00".
>	Indicates a selection string. For example: Select File>Save . This means to first select/click File then select/click Save .

Table 1: Documentation Conventions

Related Manuals and Online Help

Context-sensitive Help screens and cursor-over-help (COH) facilities are built into the Web interface. A substantial set of technical documents, white papers, case studies, etc. are available on the Lantronix web site at <u>https://www.lantronix.com/</u>.

The ION system and related manuals are listed below.

- 1. ION System x222x & x32xx NID User Guide, 33472
- 2. ION Management Module (IONMM) User Guide, 33457
- 3. ION Systems CLI Reference Manual, 33473 (this manual)
- 4. ION219-A 19-Slot Chassis Installation Guide, 33412
- 5. ION106-x Six Slot Chassis User Guide, 33658
- 6. IONPS-A-R1 Power Supply User Guide, 33614
- 7. IONPS-D-R1 Power Supply User Guide, 33707
- 8. ION Dry Contact Relay (DCR) Kit Install Guide, 33422
- 9. IONPS-A AC Power Supply Install Guide, 33423
- 10. IONPS-D DC Power Supply Install Guide, 33424
- 11. ION ADP PointSystem Card Adapter for ION Chassis 33413
- 12. SFP Module manuals (model specific)
- 13. Release Notes (software version specific)
- 14. Product Documentation Postcard, 33504

Note: This manual may provide links to third part web sites for which Lantronix is not responsible. Information in this document is subject to change without notice. All information was deemed accurate and complete at the time of publication. This manual documents the latest software/firmware version. While all screen examples may not display the latest version number, all of the descriptions and procedures reflect the latest software/firmware version, noted in the Revision History on page 2. Note: Some Documentation may have Transition Networks named or pictured. Transition Networks was acquired by Lantronix in August 2021.

Reboot and Reset Command Notes

IMPORTANT

Certain CLI commands can affect important stored files. Doing a reboot, restart or upgrade of the IONMM, a power restart of the chassis, or a reset to factory removes temporary files (e.g., configuration backup files, Syslog file). A Factory Reset also removes the permanent settings (e.g., configuration files, HTTPS certification file, SSH key).

These CLI commands can cause a loss of files:

- reboot cold start the system
- **reset** reset factory configuration
- restart restart ACL
- **upgrade** upgrade firmware modules

See the specific command description for additional information.

Command Line Editing

This section describes how to enter CLI commands.

A CLI command is a series of keywords and arguments. Keywords identify a command, and arguments specify configuration parameters.

Display Similar Commands

At the command line, you can use the $\boxed{\text{Tab}}$ key or the **?** key to show available commands in a category of commands after entering a part of the command.

For example, use the $\boxed{\text{Tab}}$ key to enter part of the command (**show ether** in this example) to display all of the available commands that start with **show ether**. The commands display in a single row.

```
C1|S7|L1D>show ether <tab key>
config loopback security statistics tdr
```

Use the ? key after a partial CLI command entry to display all of the available commands that start with **show ether**, but in a single column:

```
C1|S7|L1D>show ether ?
config
loopback
security
statistics
tdr
```

Partial Keyword Lookup

If you terminate a partial keyword with a question mark, alternatives that match the initial letters are provided. (Remember to not leave a space between the command and question mark.) For example "s?" shows all the keywords starting with "s."

Recall Commands

To recall recently-entered commands from the command history, perform one of the optional actions below:

Ctrl-P or **Up arrow** (\uparrow) key: Recall commands in the history buffer, beginning with the most recent command. Repeat the key sequence to recall successively older commands.

Ctrl-N or **Down arrow** (\downarrow) key: Return to more recent commands in the history buffer after recalling commands with Ctrl-P or the Up arrow key. Repeat the key sequence to recall successively more recent commands.

Keystroke Commands

The table below shows the optional keystrokes available to edit command lines (*indicates HyperTerm support, ** indicates command prompt support, *** indicates both HT and command prompt support by this keystroke).

Capability	Keystroke	Purpose
Move the command line around to make changes or corrections	Ctrl-B *** or left (←) arrow key ***	Move the cursor back one character
	Ctrl-F *** or right (\rightarrow) arrow key ***	Move the cursor forward one character
	Ctrl-A ***	Move the cursor to the beginning of the command line
	Ctrl-E ***	Move the cursor to the end of the command line
Recall commands from the buffer and paste them in the command line	Ctrl-Y ***	Recall the most recent entry in the buffer
	Ctrl-T **	Transpose the character to the left of the cursor with the character located at the cursor
	Ctrl-Y **	Recall the most recent entry in the buffer
Delete entries (if you make a mistake or change your mind)	Delete key *** or Backspace key ***	Erase the character to the left of the cursor
	Ctrl-D ***	Delete the character at the cursor
	Ctrl-K ***	Delete all characters from the cursor to the end of the command line
	Ctrl-U *** or Ctrl-X ***	Delete all characters from the cursor to the beginning of the command line
	Ctrl-W ***	Delete the word to the left of the cursor
	Esc D **	Delete from the cursor to the end of the word
Capitalize or lowercase words or capitalize a set of letters	Esc C *	Change case from capital to lower- case (or lower-case to capital) at the cursor
Redisplay the current command line if the switch unexpectedly sends a message to your screen	Ctrl-L *** or Ctrl-R ***	Redisplay the current command line (reverse-i-search)

Table 2:	Editing	Commands
----------	---------	----------

Command Matrix

The table below lists all of the CLI commands and categories, and indicates if the command applies to the IONMM, other NIDs, or both.

Note: CLI commands are case sensitive. Enter the CLI commands in lower case.

Table 3: CLI Command Matrix

Show Ethernet Port Loopback Running Status	x
Show Ethernet Port L2CP Configuration	x
Show Ethernet Port Security Configuration	x
Show Ethernet Port TDR Test Configuration	x
Show Ethernet Port TDR Test Result	x
Start/Stop Ethernet Port Loopback Operation	x
Start Ethernet Port TDR Test	x
Show Ethernet Statistics	x
Show TP Port Cable Length	x

Firmware Upgrade Commands	IONMM	NIDs
Show Firmware Database Update Results	х	
Show Firmware Upgrade Results	х	
Show Upgrade File Name	х	
Update Firmware Database	х	
Upgrade Device Firmware	х	

Forwarding Database Commands	IONMM	NIDs
Add Forwarding Database Entry		x
Remove a Single Forwarding Database Entry		x
Remove All Forwarding Database Entries		x
Set Forwarding Database Connection Port		x
Set Forwarding Database Entry Type		x
Set Forwarding Database Priority		x
Set Forwarding Portlist		x
Set Forwarding Port Management Access		x
Show Forwarding Database Configuration		x
Show Forwarding Database Ports		x

HTTPS Commands	IONMM	NIDs
Set HTTPS Certificate File	x	x
Set HTTPS Certificate Type	x	x
Set HTTPS Port Number	x	x
Set HTTPS Private Key File	x	x
Set HTTPS Private Key File Password	x	x
Set HTTPS State	x	x
Show HTTPS Configuration	x	x
Start HTTPS Certificate Operation	x	x

IP/DNS/DHCP Commands	IONMM	NIDs
Set DCHP Client State	x	x
Set DNS Server Number / Type / Address	x	x
Set IP Type / Address / Subnet Mask	x	x
Set Gateway Type / Address	x	x
Set IP Address Mode	x	x
Set IP Management State	x	x
Show IP Configuration	x	x
Set IPv6 Management State	x	x
Set IPv6 Address Mode	x	x

Set IPv6 Gateway Mode	x	x
-----------------------	---	---

LPT Commands	IONMM	NIDs
Set Link Pass Through Monitoring Port		x
Set Link Pass Through Status		x
Set Selective Link Pass Through Status		x
Set Transparent Link Pass Through Status		x
Show Link Pass Through Configurations		x

LOAM Commands	IONMM	NIDs
Clear LOAM Statistics		x
Get LOAM Peer Vendor OUI		x
Get LOAM Peer Information		x
Ignore Loopback Request		x
Set LOAM Admin State		x
Set LOAM Critical Event Notification State		x
Set LOAM Dying Gasp Event Notification State		x
Set LOAM Errored Frame Event Notification State		x
Set LOAM Errored Frame Threshold Value		x
Set LOAM Errored Frame Window Value		x

Set LOAM Errored Frame Period Event Notification State	x
Set LOAM Errored Frame Period Threshold Value	x
Set LOAM Errored Frame Period Window Value	x
Set LOAM Errored Frame Seconds Summary Event Notification State	x
Set LOAM Errored Frame Seconds Summary Threshold Value	x
Set LOAM Errored Frame Seconds Summary Window Value	x
Set LOAM Errored Symbol Period Event Notification State	x
Set LOAM Errored Symbol Period Threshold Value	x
Set LOAM Errored Symbol Period Window Value	x
Set LOAM Ignore Loopback Requests	x
Show LOAM Ignore Loopback Requests	x
Set LOAM Mode	x
Show LOAM Configuration	x
Show LOAM Event Configuration	x
Show LOAM Event Log	x
Show LOAM Peer Configuration	x
Show LOAM Statistics	x

MAC Learning Commands	IONMM	NIDs
Set MAC Learning Enable Portlist		х
Show Port MAC Learning State		х

Performance/RMON Statistics	IONMM	NIDs
Show RMON Statistics	x	x

QoS Commands	IONMM	NIDs
Set Default Priority for a Port		x
Set Frame Priority: Destination MAC Address is Used		x
Set Frame Priority: IEEE Tag is Used		x
Set Frame Priority: IP Tag is Used		x
Set Frame Priority: Source MAC Address is Used		x
Set Frame Priority: VLAN ID is Used		x
Set IEEE Priority Remapping		x
Set Ingress Priority Remapping		x
Set IP Traffic Class Priority Remapping		x
Set Port Egress Queuing Method		x
Set Priority Type		x
Show Priority Remapping		x

Show QoS Configuration of a Port		x
----------------------------------	--	---

RADIUS Commands	IONMM	NIDs
Set RADIUS Authentication	x	x
Set RADIUS Retry	x	x
Set RADIUS Server	x	x
Set RADIUS Server Secret	x	x
Set RADIUS Timeout	x	x
Show RADIUS Configuration	x	x

Redundancy Commands	IONMM	NIDs
Set Redundancy State	x	x
Show Redundancy Info	x	x

Serial File Transfer Protocol (X/Y/Zmodem) Commands	IONMM	NIDs
Serial Get Protocol	х	
Serial Put Protocol	х	
Serial Upgrade Protocol	х	

SNMP Commands	IONMM	NIDs
Add SNMP Community Name / Access Mode	x	
Add SNMP Group	x	
Add SNMP Local User	x	
Add SNMP Remote Engine	x	
Add SNMP Remote User Name / Address Type	x	
Add SNMP Remote User Name / Engine	x	
Add SNMP Traphost	x	
Add SNMP View Name	x	
Remove SNMP Community Name	x	
Remove SNMP Group	x	
Remove SNMP Local User	x	
Remove SNMP Remote Engine	x	
Remove SNMP Remote User Name / Address Type	x

Show SNMP Group	x	
Show SNMP Local Engine	x	
Show SNMP Local User	x	
Show SNMP Remote Engine	x	

SNMP Commands	IONMM	NIDs
Show SNMP Remote User	x	
Show SNMP Traphost	x	
Show SNMP View	x	

SNTP Commands	IONMM	NIDs
Set Current Time	x	x
Set SNTP Daylight Saving Time Status	x	x
Set SNTP Daylight Saving Start Time	x	x
Set SNTP Daylight Saving End Time	x	x
Set SNTP Daylight Saving Offset	x	x
Set SNTP Server Address	x	x
Set SNTP Status	x	x
Set SNTP Timezone	x	x
Show SNTP Configuration	x	x
Show SNTP Timezone	x	x

SSH Commands	IONMM	NIDs
Generate SSH Host Key	x	x
Remove SSH Host Key	x	x
Remove SSH Public Key From a User	x	x
Set SSH Authentication Retry	x	x
Set SSH Public Key to a User	x	x
Set SSH Server State	x	x
Set SSH Timeout	x	x
Show SSH Configuration	x	x
Show SSH Host Key	x	x
Show SSH Public Key of a User	x	x

Syslog Commands	IONMM	NIDs
Clear Syslog Records	x	x
Set Syslog Level	x	x
Set Syslog Mode	x	x
Set Syslog Server Port	x	x
Set Syslog Server Type / Address	x	x
Show Syslog Configuration	x	x

System User / Login Commands	IONMM	NIDs
Add a New System User	x	**
Change System User's Access Level	x	**
Change System User's Password	x	**
Remove an Existing System User	x	**

** Supported on IONMM or a standalone NID only.

TACACS+ Commands				
Set Tacplus Client State	х	x		
Set Tacplus Server / Retry x				
Set Tacplus Server / Secret	х	x		
Set Tacplus Server / Timeout	х	x		
Set Tacplus Server / Type / Address	х	x		
Show Tacplus Config x				
Set Login Method X X				

TFTP Transfer / Upgrade Commands	IONMM	NIDs
TFTP Get	х	x
TFTP Put	x	x
TFTP Upgrade	x	x

TNDP Commands	IONMM	NIDs
Set TNDP TX State		х
Show TNDP TX State		x

VLAN Commands		
Management VLAN Commands	IONMM	NIDs
Set Management VLAN Admin State	x	x
Set Management VLAN ID	x	x
Set Management VLAN Ports	x	x
Show Management VLAN Configuration	x	x
VLAN Device Level Commands		
Add VLAN Database Entry		x
Remove All VLANs		x
Remove a Single VLAN Database Entry		x

Set VLAN Database Member/Egress Tagging	x					
Show VLAN Database Configuration	x					
Show VLAN Service Configuration						
VLAN Port-Level Commands						
Set Ethernet Type When VLAN Tagging Mode Is Provider	x					
Set Force Port To Use Default VID	x					
Set VLAN Network Tagging Mode	x					
Set VLAN Port Admin State	x					
Set VLAN Port Default VID	x					
Set VLAN Port Discard Tagged Non-Management Frames	x					
Set VLAN Port Discard Untagged Non-Management Frames	x					
Set VLAN Port Tag Mode	x					

System Commands

The following are basic system level commands. These commands are used to show configuration / mode, show help, reboot the system, reset the configuration, and other basic functions.

Password for Login / Access

Syntax:Password: privateDescription:The default device CLI password. CLI entry requires a successful password entry.Example:Password:
Login incorrect
login: ION
Password:privateHello, this is ION command line (version 1.00).
Copyright 2009 Transition Networks.
AgentIII C1|S1|L1D>

In order to control the NIDs via a USB interface, the command line prompt must be showing the location of the module to be managed. Use the procedure below to access the NID and login via USB connection.

1. Start the terminal emulator program (e.g., HyperTerminal).

2. When the emulator screen displays, press **Enter**. The login prompt displays. If your system uses a security protocol (e.g., RADIUS, SSH, etc.), you must enter the login and password required by that protocol.

3. Type **ION** (all upper case) and press **Enter**. The password prompt displays. If a "Login incorrect" message displays, ignore it.

4. Type your password. The default is **private** (all lower case).

5. Press **Enter**. The HyperTerminal command line prompt displays (C1|S3|L1D>).

6. Enter CLI commands to set up, configure, operate, and maintain the NID.

Log Out (Quit)

Syntax :	quit
Description:	Exit the current mode and return to the previous mode (i.e., the CLI prompt).
Example :	C1 S3 L1D>q login:

Note: At IONMM FW v 1.3.14 and before, the ION System does not automatically log out upon exit or after a timeout period, which could leave it vulnerable if left unattended. Follow your organizational policy on when to sign out. At IONMM FW v 1.3.15 and above, a 15 minute inactivity timeout was added. Also note that at login, a timestamp displays while the page loads.

Clear the Screen

Syntax: cls

Description: Clears the screen.

Go Back to IONMM

Syntax:	home
Description:	Sets the command prompt back to the location of the IONMM.
Example:	If the IONMM card is in chassis 1/slot 1 and the following command was entered.
	C1 S13 L0AP1 L1P2 L2D> home
	The new command line prompt would be
	C1 S1 L1D/>

Go to Another Location

Syntax: go [c=<vv>] [s=<ww>] [l1ap=<xx>] [l2ap=<yy>] <zz>

Description: Defines the location (card or port) where subsequent commands are destined for. This information will appear on the command prompt line as the location where the command will be executed.

where:

- vv = optional; number (1–16) of the chassis where the card/port is located
- ww = optional; number (1–32) of the slot in the chassis where the card/port is located. Note: if the chassis parameter (c=) is specified you must specify a slot number.
- xx = optional; port number (1–16) on a level 1 device that is used to attach to a level 1 device.
- yy = optional; port number (1–16) on a level 2 device that is used to attach to a level 2 device.
- zz = mandatory; specifies the port or device where subsequent commands are destined for. Valid choice are:
 - **I1d** indicates the level 1 device
 - **l1p=**<port#> port number (1–16) on a level 1 device
 - I2d indicates the level 2 device
 - **I2p=**<port#> port number (1–16) on a level 2 device
 - I3d indicates the level 3 device
 - **I3p=**<port#> port number (1–16) on a level 3device
- Usage: go [c=CHASSIS] [s=SLOT] [11ap=PORT] [12ap=PORT] (11p=PORT| 12p=PORT| 13p=PORT| 11d| 12d| 13d)
- *Example 1*: The following command would cause all subsequent commands to be executed for the device in slot 5 of chassis 1.

C1|S1|L1D>**go s=5 l1d**

The new command prompt would be:

C1|S5|L1D>

Example 2: The following would cause all subsequent commands to be executed for port 2 on the device in slot 5.

C1|S5|L1D>**go 11p=2**

The new command prompt would be:

C1|S5|L1P2>

Example 3: The following would cause all subsequent commands to be executed for a remote device connected to port 2 of a chassis-resident module in slot 5.

C1|S5|L1D>**go 11ap=2 12d**

The new command prompt would be:

C1|S5|L1AP2|L2D>

Help

Syntax:	?
Description:	Display help for CLI commands by typing a question mark (?). Typing a ? at the command line prompt displays a list of base commands (show, set, etc.). To display a list of the options for a particular command or parameter, type the command/parameter then a space then ?. See Appendix A for a list of commands.
Examples:	The following will display a list of all base commands.
C1 S2 L1D> ?	
add cat cd clear cls :	Add a ACL condition Show the content of the FILES Change to another directory Clear all counters of the specified Ethernet port Clear the screen.

While the following will display a list of all the second entries for the **add** command.

```
C1|S2|L1D>add ?
acl
fwddb
soam
vlan
vlan-db
```

By typing a ? after each parameter in a command string you can see what are the options, either for what the next parameter is or for what options must be specified following an equal sign.

The following displays that there are two options available after ACL.

```
C1|S2|L1D>add acl ?
condition
rule
```

While the following displays the next parameter that follows condition.

```
C1|S2|L1D>add acl condition ?
type
```

And finally, the following shows the options that can be specified for type=.

C1|S2|L1D>add acl condition type ?

macaddr ipv4 ipv4addrrange ipv4network tcpport tcpportrange udpport udpportrange icmp

List

Syntax: list

Description: Displays all available command line commands.

Example (partial list):

C1|S5|L1D>list add acl condition type=(macaddr|ipv4addr|ipv4addrrange|ipv4network|tcpport|tcp portrange|udpport|udpportrange|icmp) srcdst=(src|dst) oper=(equal|notequal) value=VAL add acl condition type=(macaddr|ipv4addr|ipv4addrrange|ipv4network|tcpport|tcp portrange|udpport|udpportrange|icmp) srcdst=(src|dst) oper=(equal|notequal) value=VAL index=COND_ID add acl rule index=RULE_ID table=(raw|filter|nat|mangle) chain=(prerouting|input [forward|output|postrouting) prio= PRIO policy=(accept|drop|trap) [traprate=TRAPRATE] : show vlan-db config start ether tdr test start https certificate stat tftp get iptype=(ipv4|dns) ipaddr=ADDR remotefile=RFILE [localfile=LFILE] tftp put iptype=(ipv4|dns) ipaddr=ADDR localfile=LFILE [remotefile=RFILE] tftp upgrade iptype=(ipv4|dns) ipaddr=ADDR remotefile=RFILE update firmware-db file=FILENAME upgrade module C1|S5|L1D>

Note: See "Appendix A" for a complete list command listing.

Ping

Syntax.	: ping			
Descrip Examp	Description: Sends an ICMP ECHO-REQUEST to a network host and displays ping statistics (e.g., 4 packets received, 0% packet loss if successful or 0 packets received 100% packet loss if unsuccessful).			
1		1D\ ni	ng 192.168.1.10	
			.1.10 (192.168.1.10): 56 data bytes	
			m 192.168.1.10: icmp_seq=0 ttl=64 time=2.3 ms	
	-		m 192.168.1.10: icmp_seq=1 ttl=64 time=0.8 ms	
	64 byt	tes fro	m 192.168.1.10: icmp_seq=2 ttl=64 time=0.8 ms	
	64 bytes from 192.168.1.10: icmp_seq=3 ttl=64 time=0.8 ms			
			1.10 ping statistics	
	<pre>4 packets transmitted, 4 packets received, 0% packet loss round-trip min/avg/max = 0.8/1.1/2.3 ms</pre>			
	Options:			
	C1 S7 L1D> ping [OPTION] host where:			
		SIZE	Send only CNT pings Send SIZE data bytes in packets (default=56) Use IP as source address	

Quiet mode, only displays output at start and when finished

Note: the **Ping** command can only be entered from the IONMM.

-q
Ping6

Syntax:	ping6 [-c COUNT] [-t TTL] ADDR		
Description:	ription: Send ICMP ECHO-REQUEST to network hosts, where:		
	[-c COUNT] = Number of echo requests to send. Stop after sending count ECHO_RE- QUEST packets. With deadline option, ping waits for count ECHO_REPLY packets, until the timeout expires.		
	[-t TTL] = Timeout in milliseconds to wait for each reply. This sets the IP Time to Live. The TTL value of an IP packet represents the maximum number of IP routers that the packet can go through before being thrown away. In current practice you can expect each router in the Internet to decrement the TTL field by exactly one.		
	The TCP/IP specification states that the TTL field for TCP packets should be set to 60, but many systems use smaller values (4.3 BSD uses 30, 4.2 used 15).		
	The maximum possible value of this field is 255, and most UNIX systems set the TTL field of ICMP ECHO_REQUEST packets to 255. This is why you can "ping" some hosts, but not reach them via telnet or ftp.		
	ADDR = Source address to useI interface address: Set source address to specified in- terface address. Argument may be numeric IP address or name of device. This option is required for pinging an IPv6 link-local address. Must be a valid IPv6 address.		
Example:			
Agent III C1	S1 L1D>ping6 fe80::2c0:f2ff:fe20:de9e		
	c0:f2ff:fe20:de9e (fe80::2c0:f2ff:fe20:de9e): 56 data bytes		
-	<pre>m fe80::2c0:f2ff:fe20:de9e: icmp6_seq=0 ttl=64 time=0.9 ms</pre>		
-	<pre>m fe80::2c0:f2ff:fe20:de9e: icmp6_seq=1 ttl=64 time=0.8 ms</pre>		
64 bytes from fe80::2c0:f2ff:fe20:de9e: icmp6_seq=2 ttl=64 time=0.8 ms			
64 bytes from fe80::2c0:f2ff:fe20:de9e: icmp6_seq=3 ttl=64 time=0.8 ms			
	0:f2ff:fe20:de9e ping statistics ansmitted, 4 packets received, 0% packet loss		
round-trip min/avg/max = 0.8/0.8/0.9 ms Agent III C1 S1 L1D> ping6 ?			
BusyBox v1.4.1 (2011-11-07 12:05:46 CST) multi-call binary			
Usage: ping6 [OPTION] host			
Send ICMP ECHO_REQUEST packets to network hosts			
Options:			
-c C	NT Send only CNT pings		
-s S	IZE Send SIZE data bytes in packets (default=56)		
- q	Quiet mode, only displays output at start		
	and when finished		
Agent III (1	S111Dining6		
Agent III C1 S1 L1D> ping6 ping6 Send ICMP ECHO-REQUEST to network hosts.			
Agent III C1 S1 L1D>			
Messages:			
messages.			

Error: this command should be executed on a device! Ping command can only be used on management card! Ping command can only be used on local standalone card! Set ipv4 gateway address type System is busy, please retry this command later!

Process Snapshot

Syntax: ps

Description: Displays a snapshot of the current memory processes. For example:

Agent	III C1 S	1 L1D> p	s	
PID	Uid	• •		t Command
	root	312		init
2	root		SWN	[ksoftirqd/0]

18920			N	ps
Agent	III C1 S			

Show Current Directory

Syntax:	pwd
Description:	Displays the current directory.
Example:	C1 S7 L1D>pwd

Reboot

Syntax: reboot

Description: Performs a reboot ("Cold start the system") of the device in the command line prompt.

Warning: doing a reboot or restart of the IONMM will cause all configuration backup files to be lost and the USB or Telnet session to drop. This operation deletes **all** configuration information that was saved in the IONMM, including the IP address you assigned to the IONMM or NID.

Example:

C1|S18|L1D>**reboot** Warning: this command will restart system, connection will be lost and please login again! login: ION Password: Hello, this is ION command line (version 1.00). Copyright 2009 Transition Networks. C1|S1|L1D>

The HyperTerminal connection closes and the Windows Taskbar Notification area displays the message "A network cable is unplugged!."

To recover:

- 1. Close the Windows Taskbar message.
- 2. Disconnect and close HyperTerminal.
- 3. Re-open HyperTerminal.
- 4. Re-open the HT session.
- 5. Log back in to the NID.

Reset System Uptime

Syntax:	reset uptime
Description:	Resets the System Up Time counter to zero, and immediately begins to increment.
Example:	C1 S18 L1D> reset uptime C1 S18 L1D>

Note: Use the **show system info** command to display the current device uptime. **Note**: the **reset uptime** command is not available for the Power Supply modules.

Reset to Factory Default Configuration

Syntax: reset factory

Description: Resets a card to its factory default configuration.

Warning: doing a reboot or restart of the IONMM or NID will cause all configuration backup files to be lost and the USB or Telnet session to drop. This operation deletes **all** configuration information that was saved in the IONMM, including the IP address you assigned to the IONMM or NID.

Example: C1|S18|L1D>reset factory
Warning: this command will restart the specified card, connection will
be lost!
C1|S18|L1D>

The HyperTerminal connection closes and the Windows Taskbar Notification area displays the message "A network cable is unplugged!."

To recover:

- 1. Close the Windows Taskbar message.
- 2. Disconnect and close HyperTerminal.
- 3. Re-open HyperTerminal.
- 4. Re-open the HT session.
- 5. Log back in to the NID.

Doing a reboot, restart or upgrade of the IONMM, a power restart of the chassis, or a reset to factory removes temporary files (e.g. configuration backup files, Syslog file). A Factory Reset also removes the permanent settings (e.g. configuration files, HTTPS certification file, SSH key).

Slot Power On / Power Off / Reset

Syntax: set slot xx power={off|on|reset}

Description: Turns the specified slot power on or off, or performs a slot reset (reboot) function.

Where:

xx = slot number of the device

Example: C1|S16|L1P1>set slot 16 power on C1|S16|L1P1

Note: Use the **stat** command to view the chassis slot assignments.

Note: Use the show power config command to view the existing power supply configuration.

Set Power Relay State

Syntax:	<pre>set power relay state=[disable enable]</pre>
---------	---

Description: Enables or disables the Power Supply's Power Relay

Example: C1|S22|L1D>set power relay state=enable C1|S22|L1D>

Note: This command must be executed on a relay.

Note: Use the **stat** command to view the chassis slot assignments. Use the **show power config** command to view the existing power supply configuration.

Set PS Sense	or Notification / Relation / Severity / Value
Syntax:	set sensor stid=SENSORID notif=(true false)
	set sensor stid =SENSORID relation =(lessThan lessOrEqual greaterThan greaterOrEqual equalTo notEqualTo)
	set sensor stid=SENSORID severity=(other minor major critical)
	set sensor stid=SENSORID value=VALUE
Description:	Sets the Power Supply Sensor or Fan's notification, relation, severity, or value.
	where:
	SENSORID = { Temperature Voltage Power Fan }
	notif = {true enables sensor notification false disables sensor notification }. This variable controls generation of SensorThresholdNotification for this threshold.
}	relation={lessThan lessOrEqual greaterThan greaterOrEqual equalTo notEqualTo This variable indicates the relation between sensor value (SensorValue) and threshold value (SensorThresholdValue), required to trigger the alarm.
least	severity = {other minor major critical) } This variable indicates the severity of this threshold. Critical is the most severe, major is the next most severe, and minor is the severe.
	value = VALUE. This variable indicates the value of the threshold.
Note: This co	ommand must be executed on a power sensor or fan.
<i>Example</i> : and	The following commands set the power supply sensor notification, relation, severity, value for Sensor Transaction ID (stid) 9.
	C1 S22 L1D> set sensor stid=9 notif=true C1 S22 L1D> set sensor stid=9 relation=lessThan C1 S22 L1D> set sensor stid=9 severity=major

- C1|S22|L1D>**set sensor stid=9 severity=major** C1|S22|L1D>**set sensor stid=9 value=9**
- **Note**: Use the **show power config** command to display sensor configuration.

Set System Contact

Syntax: set system contact Description: The name and information of the person to contact if there is a problem with the system. The name and information can be alphabetic, numeric or a combination, but with no spaces within the text. Numbers, upper/lower case characters, and special characters (~!@#\$%^&*()_+") are allowed. *Example*: C1|S16|L1D>show system information The C2220-1014 of the Transition Networks system descr: ION (Chassis Generation III) platform products system objectID: 1.3.6.1.4.1.868.2.5.1802661751 system uptime: 3 days, 03:09:19 system contact: 999999999999999999999999 system name: C2220-1014 system location: 10900 Red Circle Drive Minnetonka, MN 5 5343 USA C1|S16|L1D>

The **show system information** command displays the system contact, system location, system name, and other system descriptive information.

Set System Location

Syntax:	set system location=LOC		
Description:	The physical location (e.g., street address) of the system. The location can be alphabetic, numeric or a combination (e.g., room 110, IT lab, etc.), but with no spaces within the text. Numbers, upper/lower case characters, and special characters (~!@#\$%^&*()_+") <u>are</u> allowed.		
Example:	C1 S16 L1D> set system location=Corporate		
	C1 S16 L1D> show syst system descr: system objectID: system uptime: system contact: system name: system location: C1 S16 L1D>	<pre>em information The C2220-1014 of the Transition Networks ION (Chassis Generation III) platform products 1.3.6.1.4.1.868.2.5.1802661751 3 days, 03:09:19 999999999999999999999999 C2220-1014 Corporate</pre>	

The default system location is 10900 Red Circle Drive. The **show system information** command displays the system contact, system location, system name, and other system descriptive information.

Syntax:	set system name=NAME		
Description:	Defines the identifying name of the device. The name can be alphabetic, numeric or a combination, but with <u>no</u> spaces within the text. Numbers, upper/lower case characters, and special characters (~!@#\$%^&*()_+") <u>are</u> allowed.		
Example:	C1 S16 L1D> set system name=<>)		
	C1 S16 L1D>show system information		
	system descr: The C2220-1014 of the Transition networks ION		
	(Chassis Generation III) platform products		
	system objectID: 1.3.6.1.4.1.868.2.5.1802661751		
	system uptime: 3 days, 03:41:07		
	system contact: 99999999999999999999		
	system name: <>)		
	system location: Corporate		
	C1 S16 L1D>		

Set System Name

The system name default is C2220-1040 (case sensitive – all capitals). The **show system information** command displays the system contact, system location, system name, and other system descriptive information.

The CLI prompt (>) displays an editable name prefix based on the "System Name" field. You can add or modify the System Name via the CLI. For example, if the name was "lab", the IONMM "System Name" is carried through to every prompt/card that you are logged into (e.g., lab C1|S3|L1D>, lab C1|S5|L1D>, lab C1|S5|L1D>, lab C1|S8|L1D>, etc.).

If you don't enter a name in the "System Name" field, the CLI prompt default remains (e.g., C1|S3|L1D>, C1|S5|L1D>, C1|S8|L1D>, etc.). So if you enter "Agent" in the System Name field, the CLI prompt would display as Agent C1|S3|L1D>, Agent C1|S5|L1D>, Agent C1|S8|L1D>, etc., but the module name in the Stack and other places in the ION Web interface would still show IONMM.

Note: Once you change the system name, that name must be used to re-login.

Set USB Port State

Syntax:	set usb-port state=(enable disable)
Description:	Defines the status of the device's USB connection (either enabled or disabled).
Example:	C1 S7 L1D> set usb-port state ? disable enable C1 S7 L1D> set usb-port state=enable C1 S7 L1D>

Note: When Console access is disabled, the NID will not respond to CLI commands entered by a local management station across the USB serial interface. The only access to the x222x/32xx NID will then be through either a Telnet session or the Web interface.

Show USB Port State

Syntax:	show usb-port state	
Description:	Displays the status of the device's USB connection	on (either enabled or disabled).
Example:	C1 S7 L1D> show usb-port state USB port state: C1 S7 L1D>	enable

Show Card Information

- *Syntax:* show card info
- *Description:* Displays the system information for the IONMM or slide-in module.
- *Example 1:* (C3221 in slot 4):

Agent III C1 S4 L1D>	show card info	
System name:	C3221-1040	
Uptime:	496 days, 11:21:22	
CPU MAC:	00-c0-f2-21-14-18	
Port number:	3	
Serial number:	11714306	
Config mode:	software	
Software:	1.3.26	
Bootloader:	1.2.1	
Hardware:	1.0.0	
Agent III C1 S4 L1D>		

Example 2: (C3220 NID in slot 6):

Agent III C1 S6 L1D	show card info	
System name:	C3220-1013	
Uptime:	02:17:51	
CPU MAC:	00-c0-f2-21-56-a5	
Port number:	2	
Serial number:	45543	
Config mode:	software	
Software:	1.3.26	
Bootloader:	1.2.1	
Hardware:	1.0.0	
Agent III C1 S6 L1D>		

Note: This command does not function for the Power Supply.

Show Card Type

Syntax:	show cardtype	
Description:	Displays the device's card type (model nur	nber).
Example 1:	(C3220 NID in slot 3):	
	AgentIII C1 S6 L1D> show cardtype Card type: C322 AgentIII C1 S6 L1D>	0-1040
Example 2:	(IONMM in slot 1):	
	AgentIII C1 S1 L1D> show cardtype	
	Card type: IONM AgentIII C1 S1 L1D>	M
Example 3:	IONPS-A power supply in slot 22):	
	AgentIII C1 S22 L1D> show cardtype Card type: IONP AgentIII C1 S22 L1D>	S-A

Show Chassis Information

Syntax: stat

Description: Displays information about all slide-in modules installed in the chassis and all standalone modules connected to the remote slide-in modules, and their ports (Example 1 below). On a remote standalone device, displays device and port information (Example 2).

Example 1: AgentIII C1|S1|L1D>stat ION statck Chassis -- BPC [1] IONMM Port 1 Port 2 [5] C6210-3040 Port 1 Port 2 level2 REM: S6210-3040 Port 1 Port 2 [7] C3210-1013 Port 1 Port 2 [8] C3221-1040 Port 1 Port 2 Port 3 [12] C2110-1013 Port 1 Port 2 [14] C2210-1013 Port 1 Port 2 [16] C2220-1014 Port 1 Port 2 [22] IONPS-A Temperature Sensor Voltage Sensor Power Sensor Fan-1 Fan-2 AgentIII C1|S1|L1D> *Example 2*: C3221-1040 C0|S0|L1D>stat ION statck Chassis -- BPC [0] C3221-1040 Port 1 Port 2 Port 3 C3221-1040 C0|S0|L1D>

Show Device Mode (local / remote0

Syntax: show switch mode

Description: Displays whether the device is in local or remote switch mode, indicating where the device is managed.

- local device is managed through a direct connection to the device.
- remote device is managed through the IONMM.

Note: The system cannot show the switch mode on all card types.

Use the **set switch mode** command to change device switch modes.

Example: C1|S3|L1D>show switch mode Switch mode: remote C1|S3|L1D>

Show Power Supply Configuration

Syntax: show power config

Description: Displays the current configuration of the specified ION system power supply.

Example: Displays the current power supply config for an ION219:

C1|S22|L1D/>show power config

Power supply sensors information: Temperature Sensor: celsius Type: Scale: units Precision: 0 Value: 30 Operation status: ok Units display: The data units displayed is degrees Threshold information: index severity relation value evaluation notifEnable -----. ------ - - - - - - - - - - - - - - othergreaterThan80falsefalseminorgreaterThan60falsefalsemajorgreaterOrEqual65falsefalsecriticalgreaterOrEqual70falsetrue 1 2 3 4 Voltage Sensor: Type: voltsAC Scale: millivolts Precision: 2 12684 Value: Operation status: ok Units display: The data units displayed for volts is mV Threshold information: index severity relation value evaluation notifEnable _ _ _ _ _ _ _ _ ---criticallessThan11220falsetrueminorgreaterThan13000falsefalsemajorgreaterOrEqual14000falsefalsecriticalgreaterOrEqual14673falsetrue 1 false 2 3 false 4 Power Sensor: Type: watts Scale: units Precision: 2 Value: 19 Operation status: Units display: ok The data units displayed for watts is units Threshold information: relation index severity value evaluation notifEnable _ _ _ _ _ _ _ _ _____ critical 10 225 250 lessOrEqual greaterThan 1 false true 2 minor major false false 3 greaterOrEqual 250 false false critical greaterOrEqual 275 4 false true

Show Slot Information

Syntax: show slot info

Description: Displays current ION Chassis slot information when entered from the IONMM.

Example:

Agent III C1|S1|L1D>show slot info Chassis BPC information: Serial number: Model name: 106005 ION106 Software: 1.3.5 Hardware: 1.0.0 Bootloader: 0.1.1 Slot information: slot slot status description power status _____ 1occupiedION Management Module AGENTon2occupiedION Media Conversion Module C2220-1014on3occupiedION Media Conversion Module C3220-1040on4occupiedION Media Conversion Module C3230-1040on5occupiedION Media Conversion Module C6010-3040on6occupiedION Media Conversion Module C6210-3040on Agent III C1|S1|L1D>

Show System Information

Syntax: show system information

Description: Displays current ION Chassis slot information.

Example 1 (C2220 in slot 16):

```
C1|S16|L1D>show system info

system descr: The C2220-1014 of the Transition networks ION

ION (Chassis Generation III) platform products

system objectID: 1.3.6.1.4.1.868.2.5.1802661751

system uptime: 2 days, 00:12:20

system contact: Lantronix (techsupport@lantronix.com)

system name: C2220-1014

system location: 10900 Red Circle Drive Minnetonka, MN 55343 USA

C1|S16|L1D>
```

Example 2 (C3220 in slot 18):

C1 S18 L1D>show	system info
system descr:	The C3220-1040 of the Transition networks ION
	(Chassis Generation III) platform products
system objectID:	1.3.6.1.4.1.868.2.5.1802661751
system uptime:	22:56:43
system contact:	Lantronix (techsupport@lantronix.com)
system name:	C3220-1040
system location:	10900 Red Circle Drive, Minnetonka, MN 55343 USA
C1 S18 L1D>	

Note: You cannot show system information on the Power Supply.

Switch Device Mode (local / remote)

Syntax: **set switch mode**={local | remote}

Description: Changes the operating mode of a standalone device. Setting the mode to **local** indicates that the device is not managed by the ION Management Module (IONMM). Instead, it is managed through either a direct USB connection or a direct network connection via Telnet or the Web interface.

Setting the mode to **remote** indicates that the device is managed through the IONMM (the default setting).

After changing the switch mode, reboot the card for the changes to take effect. At the command prompt type **reboot** and press **Enter**.

Doing a reboot will cause all configuration backup files, HTTPS certification file, SSH key file, and Syslog file to be lost.

At the command prompt, type **show switch mode** to verify the change.

Example: C0|S0|L1d/>set switch mode=local C0|S0|L1d/>show switch mode Switch mode: local

Note: The system cannot set/show the switch mode on all card types.

Management and configuration control can be switched between local management control (via CLI, Telnet or Web) or remote management control (via the IONMM).

The switch mode can be changed for the NID using only the CLI method.

The CLI command **set switch mode={local | remote}** changes the operating mode of a standalone device.

Remote Mode: the device can only be managed and configured via the IONMM. Setting the switch mode to remote indicates that the device is managed through the IONMM. The device cannot perform any IP management when in 'remote' mode. Remote mode is the C222x/C32xx default mode for all firmware versions. This is the S222x/S32xx (standalone) default mode at version 1.2 and below.

Local Mode: the device can only be configured and managed directly via CLI, Telnet or Web. Setting the mode to **local** indicates that the device is managed through either a direct USB connection or a direct network connection via Telnet or the Web interface (i.e., the device is no longer managed by the IONMM). This is the S222x/S32xx (standalone) default mode at version 1.3.10 and above. If deployed as a standalone, the mode must be set to local mode.

Set Circuit ID

Syntax: set circuit-ID=<xx>

Description: Device level command to define an ASCII text string up to 63 bytes and override the default Circuit ID, which is *vlan-module-port* in binary format, for a device and/or device ports. Use the **show circuit-ID** command to display the Circuit ID information for a device or port.

```
Example: C1|S16|L1D>set circuit XX/YYYY/000000/111/CC/SEG
C1|S16|L1D>show circuit-ID
Circuit-ID: XX/YYYY/000000/111/CC/SEG
C1|S16|L1D>
```

Note: the dash ("-") is required, and the letters "ID" must be upper-case.

Show Circuit ID

Syntax:	show circuit-ID
Description:	Device level command to display the current Circuit ID for the device or port. Use the show circuit-ID command to display the current Circuit ID information defined for a device or port.
Example:	C1 S5 L1D> set circuit-ID=xx C1 S5 L1D> show circuit-ID Circuit-ID: xx C1 S5 L1D>

Note: the dash ("-") is required, and the letters "ID" must be upper-case (in capital letters).

Note: The NID supports a Circuit ID, a company-specific identifier assigned by the user to identify the converter and individual ports in any manner desired. In the ION system, the Circuit ID port identifier is based on the agent-local identifier of the circuit (defined in RFC 3046), as detected by the agent and associated with a particular port.

Set Device Description

Syntax:	set device description=CIRCUIT	
Description:	Lets you define an ASCII text string up to 63 bytes of ASCII printable characters and override the default Device Description, which is the <i>vlan-module-port</i> in binary format, for a device and/or device ports. Use the show device description command to display the Device Description information for a device.	
Example:	C1 S16 L1D> set device description=XX/YYYY/000000/111/CC/SEG C1 S16 L1D> show device description Circuit-ID: XX/YYYY/000000/111/CC/SEG C1 S16 L1D>	

Note: the dash ("-") is required, and the letters "ID" must be upper-case. The message "Its value must be ASCII printable characters. String less than 64." displays for any invalid entry. The legal characters are: $/^{[a-zA-Z]d^{-!}@#$\%^{*}(]{[];:",.<>}-_=+///?]{0,64}$/; and the space character.$

Messages:

Cannot show device description on this card! Device description should be shorter than 64 characters! Failed to set circuit-ID on this device. Fail to set circuit-ID on this port.

Show Device Description

Syntax:	show device description
Description:	Displays the current Device Description information for the device. Use the set device description command to define the Circuit ID information for a device.
Example:	C1 S5 L1D> set device description=xxxxxx C1 S5 L1D> show device description Circuit-ID: xxxxxx C1 S5 L1D>

Note: the dash ("-") is required, and the letters "ID" must be upper-case.

Messages: Cannot set circle-ID on this port! Cannot show circuit-ID on this card! Fail to show device description on this device. Fail to show circuit-ID on this port.

Note: The x323x supports a Circuit ID and Device Description as company-specific identifiers assigned by the user to identify the ION device and individual ports in any manner desired. In the ION system, the Circuit ID port identifier is based on the agent-local identifier of the circuit (defined in RFC 3046), as detected by the agent and associated with a particular port.

Set Current Time

Syntax:	set curr-time=TIME		
	where:		
	TIME=desired time of day setting in the format <i>dd:hh:mm:ss.ts</i> (in the format days:hours:minutes:seconds.tenths of a second).		
Description:	Changes the current time of day.		
Example:	C1 S3 L1D> set curr-time="20100106 13:15:30" C1 S3 L1D>		

Note: Use the **show sntp config** command to display the current time setting in the format "*Current time*: 1970 0103 11:42:26".

Set Debug Level

Syntax:	set dbg level=<0-2>			
	where:			
	 0 = debug Severity level 0 (Emergency: system is unusable - e.g., serious hardware failure or imminent power failure). 1 = debug Severity level 1 (Alert: action must be taken immediately). 2 = debug Severity level 2 (Critical condition). 			
Description:	Defines the system debug level.			
Example:	C1 S5 L1D> set dbg level 0 C1 S5 L1D> set dbg level 1 C1 S5 L1D> set dbg level 2 C1 S5 L1D>			

System User / Login Commands

These commands let the ION system administrator add, define, display, and remove ION system users. Each user has a user name, access level, and password.

The three levels of ION system login user rights are described in the table below.

Level	Change own password?	Read configs?	Write configs though Web/CLI (1)	Upgrade / Backup / Restore ?	Create new users, Delete users (not itself and ION)?
Admin	Yes	Yes	Yes	Yes	Yes
Read- Write	Yes	Yes	Yes	No	No
Read-only	Yes	Yes	No	No	No

 Table 4: User Level Rights via Web / CLI

Note (1): (except for upgrade and backup/restore)

- An Admin user has full rights to read/write all configurations through Web/CLI. An admin user can create new users and delete any users other than itself and ION.
- A **Read-Write** user can read/write all configurations except for Upgrade and Backup/Restore via the Web or CLI. A read-write user can also change its own login password. When a read-write user logs in via the Web, the "UPGRADE" tab and the "BACKUP/RESTORE" tab are disabled. When a read-write user logs in via the CLI, all **set** commands except for upgrade and backup/restore can be executed.
- A **Read-Only** user can read all configurations except for Upgrade and Backup/Restore though the Web/CLI. When a read-only user logs into the Web interface, the Web interface will be disabled (like hardware mode) and only its own login password can be changed. When a read-only user logs in CLI, all set commands will be invisible and only its own password can be changed.
- The one default **Admin** user is "ION". Its default password is "private". This user cannot be deleted.
- This user management does not apply to Focal Point.
- Doing an SNMP get operation on the password object will return "*******" (eight '*'s).

An error message displays if you enter a CLI command outside of your system login user level (e.g., *ERROR: Current user is not authorized to do this operation!* or % *There is no matched command*).

You can add, edit and delete ION system users via the CLI method or via the Web interface.

Syntax:	add sysuser name=NAMESTR level= <admin read-write read-only> pass=PASSSTR confirmpass=PASSST</admin read-write read-only>
Description:	Add (create) a new ION system user and define the new user's access level and pass word. This command is available to Admin users only.
	where:
	name = NAMESTR = the new user's username.
	level = the new user's access level (administrator, read-write, or read-only).
	pass = PASSSTR = the new user's password string.
	confirmpass = PASSSTR = the new user's password string.
Privilege:	Admin level login users only.
Example:	C1 S1 L1D> add sysuser name= NAMESTR level =read-write pass =PASSSTR
	C1 S1 L1D>

Add a New System User

Set System User's Access Level

Syntax: set sysuser name=NAMESTR level=<admin|read-write|read-only>

Description: Edit (change) an existing ION user's name and access level. This command is available to Admin users.

where:

name = NAMESTR = the existing user's new username.

level = the user's new access level; either **admin**istrator, **read-writ**e, or **read-only**.

Example:

C1|S1|L1D>**add sysuser name=**NAMESTR **level=**read-write **pass=**PASSSTR C1|S1|L1D>**set sysuser name=**NAMESTR **level=**read-only

C1|S1|L1D>

Set System User's Password

Syntax:	set sysuser name=NAMESTR pass=PASSSTR confirmpass=PASSSTR	
Description:	Edit (change) an existing ION system user's password.	
	where:	
	name = NAMESTR = the user's new username. pass = PASSSTR = the user's new password string. confirmpass = PASSSTR = the user's new password string; type the same as pass above.	
Privilege:	An Admin user can set any login password. A Read-Write user can only change their own password. A Read-Only user can only change their own password.	
Example:		
C1 S1 L1D> se C1 S1 L1D>	t sysuser name=NAMESTR pass=PASSSTR confirmpass=PASSSTR	

Remove an Existing	system User
---------------------------	-------------

Syntax:	remove sysuser name=NAMESTR
Description:	Removes an existing ION system user. This command is available to Admin users.
	where: name = NAMESTR = the existing user's new username.
Privilege:	Only an Admin user can create new users and delete any users other than itself and ION.
Example:	C1 S1 L1D> remove sysuser name=NAMESTR C1 S1 L1D>

Show All System Users

Syntax:	show sysuser <cr></cr>
Description:	Displays information on all of the ION users currently configured for use.
	The information includes the User name, User level (admin istrator, read-writ e, or read-only) and password. This command only works on an IONMM or a standalone SIC. This command is available to all SNMP users at all privilege levels.

Example 1 (default user):

C1 S1 L1D> show	sysuser		
name	level	password	
ION	admin	*****	
C1 S1 L1D>			

Example 2 (additional users):

C1 S1 L1D> show sysuser		
name	level	password
ION	admin	*****
AndersonT	read-write	*****T
BensonJ	read-write	*****T
CarlsonAnn	read-write	*******nn
CarlsonBob	read-only	******ob
DobsonV	read-only	******ob
EffertzC	read-only	*****
Fitz	read-only	*****
GomesD	read-only	*****
JeffS	read-write	*****
C1 S1 L1D>		

ACL Commands

The Access Control List (ACL) is a collection of permit and deny rules and conditions that provide security across an Ethernet connection by blocking unauthorized users and allowing authorized users to access specific resources. Consider the following when configuring ION system ACLs:

- 1. If the NID is managed by the ION Management Module (IONMM), configuring ACL should be done at the IONMM and not at the NID.
- 2. The ACL does not control access to the NID through a serial interface (USB connection).
- 3. The ION system supports the configuration of the INPUT chain of the filter table of Linux iptables; all rules being added belong to the INPUT chain of the filter table.
- 4. At least one condition is needed for a rule before the rule can work. After you create a rule, you also need to create at least one condition for it.
- 5. Multiple conditions can be assigned to one rule; only when all conditions of the rule are matched for an input packet, the policy of the rule can be applied to it.
- 6. If multiple rules are matched to an input packet, the rule with the highest priority will be applied.
- 7. You can add/modify/delete a rule or a condition whether the ACL is enabled or disabled.
- 8. Since only the configuration for INPUT chain of the filter table is supported, there is no option to select the table-type and chain-type. They are fixed values: table is filter and chain is INPUT. This table and chain meets most, if not all, ACL functionality requirements.
- 9. The x222x/x32xx NIDs do not support two ACL conditions with the same condition type.
- 10. Configure both a rule and a condition; even if a rule is configured without a condition, the top ACL condition applies to all packets.
- **NOTE:** These commands can only be entered when the last part of the command line prompt indicates the location is a device (L1D, L2D or L3D). These commands cannot be entered at the port level.

In a very basic sense, ACLs consist of <u>chains</u>, <u>rules</u>, and <u>conditions</u>.

A <u>chain</u> is a table that contains a set of rules, usually for a particular function such as input or output. The chain also defines a default policy that will be used if a policy is not determined by the end of processing for all rules. The only chain that can be specified for the x222x / x32xx NID is INPUT. This chain contains the rules and conditions for accessing the NID through an Ethernet connection (via Telnet session or Web interface).

An ACL <u>rule</u> defines the policy to be followed for certain defined conditions. There are three different policies (rules) that can be defined for the NID:

- Accept allow communication from the device
- **Drop** disallow communication from the device
- Trap initiate an SNMP trap message

The <u>conditions</u> of an ACL define the objects the policies apply to (e.g., MAC or IP addresses, ports, etc.).

ACLs are read from top to bottom. When a packet comes to the NID, it is matched against the first line in the ACL; if it does not meet the criteria, then it drops to the next line and so on until it reaches a permit or deny that fits it. For all ACLs there is an implied deny beneath the last line of the ACL. When applying an ACL to an interface, it is recommended that there be at least one permit statement.

The process used to create an ACL generally includes these steps:

- 1. Enable ACL using the set acl state=enable command.
- 2. Define default chain policy using the **set acl table**=filter **chain**=input **policy=**<ptype> command.
- 3. Define one or more conditions using the command:

add acl condition type=<xx> srcdst={src | dst} oper={equal | notequal} value=<yy>

4. Define one or more rules using the command:

add acl rule index=<inum>position={head | tail} table=filter chain=input policy={accept | drop |
trap} traprate=<rate> condition=<list>

The ACL Commands vary between IPv4 and IPv6 as described in the following sections.

ACL Commands for IPv4

The following commands are used for ACL operations under IPv4.

Add a New ACL Condition

Syntax:	add acl condition type= <ww> srcdst=<xx> oper=<yy> value=<zz></zz></yy></xx></ww>						
Description:	Creates a new ACL condition.						
	where:	where:					
	ww = condition type; valid choices are:						
	• macaddr	• ipv4network	• udpport				
	 ipv4addr 	• ipv4addrrange	udpportrange				
	 tcpport 	tcpportrange	• icmp				
	xx = restriction stream; valid choices are:						
	• src (source)						
	• dst (destination)						
	yy = operation type; va	alid choices are:					

- equal (the condition applies if the packet equals the condition type)
- **notequal** (the condition applies if the packet does not equal the condition type)
- zz = address, port number, or type associated with the value specified for type=.
- Note: if **ipv4addrrange**, **tcpportrange** or **udpportrange** is specified for **type=**, then the two values (range) specified for num must be separated by a hyphen (i.e., 1–4).

Example:

C1|S18|L1D>add acl condition type=ipv4addr srcdst=src oper=equal value=172.16.6.123 C1|S18|L1D>

Add a New ACL Rule

- Syntax: add acl rule position=<ww> table=filter chain=input policy=<xx> traprate=<yy> condition=<zz>
- *Description:* Creates a new ACL rule.

where:

- ww = whether the new rule is put to the top or end of rule list; valid choices are:
 - head
 - tail
- xx = ACL policy type; valid choices are:
 - accept (if the rule is met, packets are to be accepted)
 - drop (if the rule is met, packets are to be dropped)
 - trap (if the rule is met, a trap is to be sent)
- yy = number (1 65535) of times the trap can be sent in a minute
- zz = index numbers of the conditions that will be assigned to the rule.

If more than one condition is specified, each must be separated by a comma with no spaces (e.g., 2,3,6).

Usage: add ad rule position=(head | tail) table=(filter) chain=(input) policy=(accept | drop | trap) [traprate=TRAPRATE] [condition=CONDLIST]

Example:

```
C1|S18|L1D>add acl rule position=head table=filter chain=input policy=trap
traprate=100
C1|S18|L1D> show acl rule
index table-type chain-type priority policy traprate(packets/min) condition
1 filter input 1 trap 100 no
C1|S18|L1D>
```

Remove ACL Condition(s)

Syntax:	remove acl condition={ <xx> all}</xx>					
Description:	Removes the specified ACL condition definition.					
	where:					
	xx = index number of the condition to be removed					
	all = remove all conditions					
Example:	C1 S5 L1D>remove acl condition 1 C1 S5 L1D>show acl ? chain condition rule state C1 S5 L1D>show acl condition No ACL condition now! C1 S5 L1D>					

Remove ACL Rule(s)

Syntax:	remove acl rule={ <xx> all}</xx>				
Description:	Removes the specified ACL rule definition.				
	<pre>where: xx = index number of the rule to be removed all = remove all rules</pre>				
Example:	C1 S5 L1D>remove acl rule 1 C1 S5 L1D>show acl ? chain condition rule state C1 S5 L1D>show acl rule No ACL rule now! C1 S5 L1D>				

Restart ACL

Syntax:	restart acl		
Description:	Restarts the ACL (firewall).		
Example:	C1 S5 L1D>restart acl		
	C1 S5 L1D>		

Syntax:

Set ACL State

Syntax: set acl state={enable | disable}

Description: Enables or disables ACL operations.

Example: C1|S5|L1D>set acl state ?
 disable
 enable
 C1|S5|L1D>set acl state enable
 C1|S5|L1D>set acl state
 ACL management state: enable

set acl table=filter chain=yy policy=zz

Set ACL Chain Default Policy

Description: Changes the default policy of an ACL chain. You must specify the filter, chain, and policy for each rule you create.

Where:

xx = filter yy = chain= input zz = policy=(accept|drop}

Example:	C1 S7 L1D> set acl table=filter chain=input policy=accept
	C1 S7 L1D>

Note: the defaults are **table=filter** and **chain=input** which cannot be changed.

Set Certain Conditions to a Rule

Syntax:	set acl condition= <xx> rule_index=<yy></yy></xx>				
Description:	Applies a defined condition to a particular rule.				
	where:				
	xx = index number of the condition to be applied to rule yy				
	yy = index number of the rule to which condition xx is to be applied				
Example:	C1 S3 L1D> set acl condition=1 rule_index=1 C1 S3 L1D>				

Note: A rule index must already exist. If the specified ACL rule has not previously been defined, the message "*Invalid ACL rule index*!" displays.

Set Trap Rate of a Rule

Syntax: set acl rule=<xx> traprate=<yy>

Description: Sets the trap rate of an ACL rule. The Trap Rate is a value indicating the number of traps that will be sent in one minute. This is the trap rate of a rule if this rule is a used for trap. The valid range is from 1 - 65,535 packets/minute. The default is 1 packet/minute.

Note: this command only applies to rules with **policy=trap** specified.

where:

xx = index number of the rule to which the trap rate will apply

yy = trap rate (1 - 65,535 ppm)

Example: C1|S3|L1D>set acl rule=2 traprate=500
The specified ACL rule index does not exist!
C1|S3|L1D>set acl rule=1 traprate=500
C1|S3|L1D>

Note: The specified ACL rule index must already exist.

Show ACL State

Syntax: show acl state

Description: Displays whether ACL is enabled or disabled.

Example: C1|S3|L1D>show acl state
ACL management state: disable
C1|S3|L1D>

Show All ACL Conditions

Description: Displays all defined ACL conditions.

Example:

C1 S7 L1D> show acl condition						
index	type	src/dst	operation	value	rule idx	
1	ipv4addr	src	equal	172.11.1.1 0		
2	ipv4addr	src	equal	192.168.1.30	1	

An ACL condition must already have been created. If no ACL conditions are yet defined, the message "No ACL conditions now!" displays.

Show All ACL Rules

Syntax: show acl rule

Description: Displays all defined ACL rules.

Example:

	• •	D>show acl rul						
	index	table-type	chain-type	priori	ty policy	/	traprate(packets/min)	conditions
		C'1	• • • •				4500	
-	1	filter	input	1	trap		1500	2
1	2	filter	input	3	accept	10		1
	3	filter	input	6	drop	100)	4

An ACL condition must already have been created. If no ACL rules are yet defined, the message "*No ACL rule now!*" displays.

Show All IPtable Chain Definitions

Syntax: show acl chain

Description: Displays all defined ACL chains.

Example:	C1 S13 L0D/> show acl chain								
	table-type	contain-type	default-policy						
	filter	input	INPUT	accept					

ACL Commands for IPv6

You can set up to 255 ACL Rules and up to 255 ACL Conditions. Note that since ACL rules and conditions must process dynamic tables and check the relationship between multiple tables, the ACL show commands need more time to display the content compare to other tables. These commands can only be executed on IONMM or a standalone NIC.

The following commands are used for ACL operations under IPv6.

Command:	Set IPv6 Tables ACL State
Syntax:	set ip6tables acl state=(enable disable)
Description:	Device level command (IONMM or a standalone NID only) to enable or disable the IPv6 ACL function.
Example:	Agent III C1 S1 L1D> set ip6tables acl state=enable Agent III C1 S1 L1D>
Messages:	Fail to set IPv6 ACL state!
Command:	Show IPv6 Tables ACL Management State
Syntax:	show ip6tables acl state
Description:	Device level command (IONMM or a standalone NID only) that displays the current ACL management state.
Example:	Agent III C1 S1 L1D> show ip6tables acl state ACL of IPv6 tables management state: enable
	Agent III C1 S1 L1D>
Messages:	Getting ACL IPv6 state fail!
Command:	Restart ACL of IPv6 Tables
Syntax:	restart ip6tables acl
Description:	Device level command (IONMM or a standalone SIC only) to restart the ACL of IPv6 ta- bles.
Example:	Agent III C1 S1 L1D> restart ip6tables acl Agent III C1 S1 L1D>
Messages:	Fail to restart IPv6 tables ACL!

Command: Show IPv6 Table	s ACL Chain
--------------------------	-------------

Syntax: show ip6tables acl chain

Description: Device level command (IONMM or a standalone SIC only) to display the IPv6 tables ACL chains.

Example:

•	S1 L1D>show ip61		
table-type	contain-type	Cnain-name	default-policy
filter C1 S3 L1D>	input	INPUT	accept
Massagas:	Eail to get in Stable	c ACL chain policyl	

wessuges.	Full to get ipotubles ACL chain policy:	

Command:	Set IPv6 Tables ACL Chain Policy
Syntax:	<pre>set ip6tables acl table=(raw filter nat mangle) chain=(prerouting input forward output postrouting) policy=(accept drop)</pre>
Description:	Device level command (IONMM or a standalone SIC only) to configure the ACL table, chain, and policy. Note that the value of table can only be "filter" and the value of chain .

Example:

Agent	III	C1	S1	L1D> set	ip6	acl	table	filter	chain	input	policy	accept
Agent	III	C1	S1	L1D>								
Messa	ges:		No	w the valu	ie of	table	can on	ly be \"fil	lter\			

Now the value of chain can only be \"input\

Command: Show IPv6 Tables ACL Rules

Syntax: show ip6tables acl rule

Description: Device level command (IONMM or a standalone SIC only) to display the current ACL table, chain, and policy. Note that the value of **table** can only be "filter" and the value of **chain** can only be "input".

Example:

	S1 L1D> show ip6 -type chain-type			<pre>traprate(packets/min)</pre>	condition	
1 filte Agent III C1	· • • •	1	trap	0 0	no	
Messages:	Fail to find first row No ACL rule now! Fail to get ACL rule Fail to get ip6table Fail to get ip6table Fail to get ip6table Fail to get ip6table	! s ACL rule to s ACL rule ch s ACL rule pi s ACL rule pi s ACL rule pi	able type! hain type! riority! plicy!			

Command:	Create an IPv6 Tables New ACL Rule					
Syntax:	add ip6tables acl rule position=(head tail) table=(raw filter nat mangle) chain=(prerouting input forward output postrouting) policy=(accept drop trap) [traprate=TRAPRATE] [condition=CONDLIST]					
Description:	Device level command (IONMM or a standalone SIC only) to add a new ACL rule.					
	Note that the value of table can only be "filter" and the value of chain can only be "in- put".					
	The traprate and condition entries are optional. The position part sets the rule being added at the tail or head of the chain.					
Example:						
Agent III C1	Agent III C1 S1 L1D>add ip6tables acl rule position=head table=filter chain=input policy= trap					

Agent III C1|S1|L1D>**show ip6tables acl rule** index table-type chain-type priority policy traprate(packets/min) condition 2 filter input 1 trap 0 no 1 filter input 2 trap 0 no Agent III C1|S1|L1D>

Messages: Fail to set ip6tables ACL chain type! Fail to set ip6tables ACL policy! Fail to set ip6tables ACL priority! Fail to set ip6tables ACL row status! Fail to set ip6tables ACL table type! Now the value of table can only be \"filter\"! Now the value of chain can only be \"input\"! Please input a digital number to specify the ACL condition index! Please input a number to specify the ACL rule index! The specified condition index does not exist!

 Command:
 Create a New IPv6 Tables ACL Rule

 Syntax:
 add ip6tables acl rule index=RULE_ID table=(raw|filter|nat|mangle) chain=(prerouting|input|forward|output|postrouting) prio= PRIO policy=(accept|drop|trap) [traprate=TRAPRATE]

 Description:
 Device level command (IONMM or a standalone SIC only) to add a new ACL rule for provisioning. Note that the value of table can only be "filter" and the value of chain can only be "input". The traprate and condition entries are optional. The position part sets the rule being added at the tail or head of the chain.

Example:

Agent III C1|S1|L1D>add ip6tables acl rule position=head table=filter chain= input policy=trap traprate=400 Agent III C1|S1|L1D>
Command:	Set IPv6 Tables ACL Rule Trap Rate
Syntax:	set ip6tables acl rule=<1-255> traprate=<1-65535>
Description:	Device level command (IONMM or a standalone SIC only) to configure an IPv6 ACL rule and its trap rate.
Example:	Agent III C1 S1 L1D> set ip6tables acl rule=1 traprate=655 Agent III C1 S1 L1D>
Messages:	Cannot set trap rate when policy is not trap! Fail to get ACL rule traprate! Fail to set ACL traprate! The specified ACL rule does not exist! The specified ACL rule index does not exist!
Command:	Remove a Specified IPv6 Tables ACL Rule
Syntax:	remove ip6tables acl rule=<1-255>
Description:	Device level command (IONMM or a standalone SIC only) to delete a specified IPv6 ACL rule from the rules table.
Example:	Agent III C1 S1 L1D> remove ip6tables acl rule index 1 Agent III C1 S1 L1D>
Messages:	Fail to remove ACL rule! The specified ACL rule does not exist!
Command:	Remove All IPv6 Tables ACL Rules
Syntax:	remove ip6tables acl rule all
Description:	Device level command (IONMM or a standalone SIC only) to delete all existing IPv6 ACL rules from the rules table.
Example:	Agent III C1 S1 L1D> remove ip6tables acl rule all Agent III C1 S1 L1D>
Messages:	Fail to remove ACL rule! The specified ACL rule does not exist!
Command:	Remove All IPv6 Tables ACL Conditions
Syntax:	remove ip6tables acl condition all
Description:	Device level command (IONMM or a standalone SIC only) to delete all existing IPv6 ACL conditions from the conditions table.
Example:	Agent III C1 S1 L1D> remove ip6tables acl condition all Agent III C1 S1 L1D>
Messages:	Fail to remove ACL condition!

Command: Show All IPv6 Tables ACL Conditions	Command:	Show All IPv6 Tables ACL Conditions
--	----------	-------------------------------------

Syntax: show ip6tables acl condition

Description: Device level command (IONMM or a standalone SIC only) to display all currently configured IPv6 ACL conditions.

Example:

Lantronix

Agent III index	C1 S1 L1D> show type	-	acl condit operation		rule	idx
1 2	ipv6addr ipv6addr	src src	equal equal	::		0 0
3	ipv6addr	src	equal	::		0
4	ipv6addr	src	equal	fe80::2c0:f2ff:fe20:de9	9e 0	
Agent III	C1 S1 L1D>					

Messages: Fail to get ip6tables ACL condition! Fail to get ip6tables ACL condition index! Fail to get ip6tables ACL condition operation! Fail to get ip6tables ACL condition rule index! Unknown ICMP type!

Command:	Set IPv6 Tables ACL Condition Rule Index
Syntax:	set ip6tables acl condition=<1-255> rule_index=<0-255>
Description:	Device level command (IONMM or a standalone SIC only) to configure a new IPv6 ACL condition and its rule index.
Example:	Agent III C1 S1 L1D> set ip6tables acl condition=1 rule_index=1 Agent III C1 S1 L1D>
Messages:	ERROR: already have the same Condition Type under this rule! Invalid ip6tables ACL rule index!

Command:	Remove an IPv6 Tables ACL Condition	
Syntax:	remove ip6tables acl condition=<1-255>	
Description:	Device level command (IONMM or a standalone SIC only) to remove (delete) a specified	
Description.	IPv6 ACL condition, or all existing conditions, from the table.	
Example:	Agent III C1 S1 L1D>remove ip6tables acl condition ? all index Agent III C1 S1 L1D>remove ip6tables acl condition index ?	
	<pre><1-255> Agent III C1 S1 L1D>remove ip6tables acl condition index 1 Invalid ACL condition index!</pre>	
	Agent III C1 S1 L1D>	
Messages:	Invalid ACL condition index! Fail to remove ACL condition!	
Command:	Add an IPv6 Tables ACL Condition	
Syntax:	add ip6tables ad condition type= (macaddr ipv6addr ipv6network tcpport tcpportrange udpport udppor- trange icmp) srcdst= (src dst) oper= (equal notequal) value= VAL	
Description:	Device level command (IONMM or a standalone SIC only) to create and define a new IPv6 ACL condition, <u>where</u> :	
	type=(Mac addr, IPv6 addr, IPv6 network, TCP port, TCP port range, UDP port, UDP port range, or ICMP (Internet Control Message Protocol)).	
	srcdst =(src dst) whether this condition is at the source (src) or the destination (dst).	
	oper =(equal notequal) the operation for this condition; 'equal to' or 'not equal to'.	
	value=VAL; a valid IPv6 address (e.g., value=fe80::2c0:f2ff:fe20:de9e).	
Example:		
Agent III C1 S1 L1D>add ip6tables acl condition type ? macaddr ipv6addr ipv6network tcpport tcpportrange udpport udpportrange		
oper=equal v Agent III C	1 S1 L1D> add ip6tables acl condition type=ipv6addr srcdst=src value=fe80::2c0:f2ff:fe20:de9e 1 S1 L1D>	
Messages:		

Fail to add ACL addition! Invalid condition valule (e.g., an invalid UDP port range entered - outside the valid range of port 1 - 8). *Inavlid condition value!* (e.g., a valid mask has 2 formats; one is a integer of bit mask such as 2001::1002/96, the other is an IPv6 address such as 2001::2000/ffff:ffff::). Enter one of the two valid condition values and continue operation.

ACL CLI Messages

Message: *ERROR*: *already have a ipv6Condition Type under the same level!* **Meaning**: You tried to enter two similar IPv6 ACL Conditions for the same Rule, but the entry failed. **Recovery**:

- 1. Verify the IPv6 ACL parameter entries; see "IPv6 ACL (Access Control List)" on page 6.
- 2. Contact Technical Support if the problem persists.

Message:

Bad condition index %u, its range is from 1 to 255! Please input a digital number to specify rule index! Invalid rule index!

Please input a digital number to specify trap rate!

Meaning: You tried to enter too many ACL rules.

Recovery:

1. Make sure you enter less than 255 entries; see "IPv6 ACL (Access Control List)" on page 6.

2. Contact Technical Support if the problem persists.

Message:

All-zero MAC address is not valid for ACL ipv6 condition! All-zero MAC address is not valid for ACL condition! **Meaning**: You tried to enter an invalid IPv6 ACL address of all zeros. **Recovery**:

1. Enter a valid IPv6 address; see "IPv6 ACL (Access Control List)" on page 6.

2. Contact Technical Support if the problem persists.

Backup / Restore (Provision) Commands

The following commands are used to show, backup, and restore prov modules, and to set provision module configuration. **Note**: These commands can only be entered on the IONMM or a standalone SIC. **Note**: starting at v 1.3.10, Backup file name and TFTP upload/download file name are extended to a maximum of 128 characters.

Backup

Command: Syntax: Description:	Backup Specified Provision Module(s)backup module list xxDevice level command used to perform a configuration Backup of the specified provision modules (up to ten cards at a time). This command can only be executed onIONMM or a standalone S222x/S32xx NID in "Local" mode. Specify 1-10 provision modules to be backed up. Type backup module-list=xx and press Enter. This command is available to Admin level users. Where:module-list = the provision module indexes displayed by the "show provision backup modules" command.
Example:	C1 S1 L1D> backup module-list ? STR_MODULE_LIST C1 S1 L1D> backup module-list 1 Processing Processing Backup finished C1 S1 L1D>

Restore

Command: Syntax: Description:	Restore Specified Provision Module(s) restore module-list=STR_MODULE_LIST Device level command used to perform a Restore function on the specified provision modules (up to ten cards at a time). This command can only be executed on IONMM or a standalone S222x/S32xx NID in "Local" mode. Specify a <u>restore</u> index item number and a config file name. Type restore module-list=<1-256> config-file=STR_CFG_FILE and press Enter . This command is available to Admin level users. Where: module-list = the provision module indexes displayed by the "show provision restore modules" command.
Example:	C1 S1 L1D>restore module-list 1 Processing Processing Processing Restore finished C1 S1 L1D> "Processing "Restore finished

Set Backup Module Index

Command:	Set Backup Module Configuration
Syntax:	set backup module-index=<1-256> config-file=STR_CFG_FILE
Description:	Device level command used to set the backup configuration file name for one or more specified provision modules (up to 256 modules can be specified). The provision configuration file name maximum length is 64 alphanumeric characters. This command can only be executed on IONMM or a standalone S222x/S32xx NID in "Local" mode. Note: this command is no longer supported after FW v 1.3.17. The specified module must already exist. This command is available to Admin level users only. Where:
	module- index = provision module index displayed by the "show provision backup modules" command. config-file = config file name of the specified module- index.
Example:	C1 S1 L1D> set backup module-index 1 config-file xxxx C1 S1 L1D>

Set Restore Module Index

Command:	Set Restore Module Configuration
Syntax:	set restore module-index=<1-256> config-file=STR_CFG_FILE
Description:	Device level command used to set the restore configuration file name for one or more specified provision modules (up to 256 modules can be specified). The provision configuration file name maximum length is 64 alphanumeric characters. This command can only be executed on IONMM or a standalone S222x/S32xx NID in "Local" mode. The specified module must already exist.
	Note: this command is no longer supported after FW v 1.3.17.
	This command is available to Admin level users only. Where:
	module- index = provision module index displayed by the "show provision restore modules" command. config-file = config file name of the specified module- index.
Example:	C1 S1 L1D> set restore module-index 1 config-file xxxx C1 S1 L1D>

Show Provision Modules

Syntax: show provision backup modules show provision restore modules

Description: Device level command to show all modules that can perform backup and restore operations. This command displays the current provision status {"ongoing", "success", or "fail"}. It causes a search of the physical entity table to find out the physical entity. This command can only be executed on the IONMM or a standalone S222x/S32xx NID in "Local" mode. This command is available to Admin users only.

IONMM Backup All / Restore All

IONMM v 1.3.18 adds Backup All and Restore All capabilities. The new Backup All and Restore All features can be configured via the ION System Web GUI or CLI commands. The Backup/Restore feature provides Automatic TFTP transfer, Backup and restore of up to 41 modules at one time, Time-stamped filenames that include the stackname and index number, and Time-stamped tarfile containing all the config files. See the IONMM User Guide for details.

Bandwidth Commands

The following commands are used to set bandwidth limiting rates.

Note: These commands can only be entered when the last part of the command line prompt indicates the location is a port (LxPx; where x is 1 or 2 for the x3230). These commands cannot be entered at the device level – only at the port level.

Set Bandwidth Rate Limiting Mode

Syntax: set bw alloc-type={countAllLayer1 | countAllLayer2 | countAllLayer3}

Description: Defines which transmission layer is to be counted when determining the rate limit. **Note**: this command is not supported on all models.

- Counts All Layer 1: (the default): in determining the rate limit, this selection counts the following bytes in a frame: Preamble (8 Bytes) + DA to CRC + Inter Frame Gap (12 bytes).
- **Counts All Layer 2**: in determining the rate limit, this selection counts the bytes in a frame from the DA to the CRC in determining the rate limit.
- **Counts All Layer** 3: in determining the rate limit, this selection counts the following bytes in a frame:
 - from the DA (Destination MAC Address) to the CRC (18 bytes if untagged)
 - o from the DA(Destination MAC Address) to the CRC (22 bytes if tagged)

Note: The Counts All Layer 3 selection will skip the Ethernet header, the CRC, and Tags (if any tags exist).

Example: C1|S5|L1P1>set bw alloc-type=countAllLayer2

C1 S5 L1P1>show bandwidth a]	llocation
Bandwidth allocation type:	countAllLayer2
Ingress rate:	unLimit
Egress rate:	unLimit
C1 S5 L1P1>	

Set Bandwidth Rate Limit

Syntax:	set irate= <xx> erate=<yy></yy></xx>
Description:	Defines the ingress and egress rate limits of a port.
	where:
	xx= In-rate: Ingress rate in kbps
	yy = Egress-rate: Egress rate in kbps
	The valid selections are:
	x222x, x322x, x323x ingress and egress rate limiting:
	 On 1000M port: Unlimited, 1M, 2M, 3M, 4M, 5M, 6M, 7M, 8M, 9M, 10M, 15M, 20M, 25M, 30M, 35M, 40M, 45M, 50M, 55M, 60M, 65M, 70M, 75M, 80M, 85M, 90M, 95M, 100M, 150M, 200M, 250M, 300M, 350M, 400M, 450M, 500M, 550M, 600M, 650M, 700M, 750M, 800M, 850M, 900M, and 950M bps. On 100M port: 1M, 2M, 3M, 4M, 5M, 6M, 7M, 8M, 9M, 10M, 15M, 20M, 25M, 30M, 35M, 40M, 45M, 50M, 55M, 60M, 65M, 70M, 75M, 80M, 85M, 90M, and 95M bps.
Example:	Agent III C1 S1 L1P1>set irate rate10M erate rate10MError: Cannot set ingress and egress rate on this card!Agent III C1 S1 L1P1>go c=1 s=9 l1p=1Agent III C1 S9 L1P1>set irate rate1M erate rate1MAgent III C1 S9 L1P1>show bandwidth allocationBandwidth allocation type:countAllLayer1Ingress rate:rate1MEgress rate:rate1MAgent III C1 S9 L1P1>set irate rate9M erate rate10% Ambiguous command.Agent III C1 S9 L1P1>set irate rate9M erate rate10MError: Cannot set erate because erate is bigger than port speed!Agent III C1 S9 L1P1>show bandwidth allocationBandwidth allocation type:countAllLayer1Ingress rate:rate9M erate rate2MAgent III C1 S9 L1P1>show bandwidth allocationBandwidth allocation type:countAllLayer1Ingress rate:rate9MEgress rate:rate2MEgress rate:rate2M
Messages:	Agent III C1 S9 L1P1> Error: Cannot set erate because erate is bigger than port speed!

Note: The rate parameters are case-sensitive. Use the **show bandwidth allocation** command to verify the setting. This command does not work on the IONMM ports.

Show Bandwidth Allocation Configuration

Syntax: show bandwidth allocation

Description: Shows the bandwidth allocation type and ingress and egress rates for a port.

Example:C1|S5|L1P1>set bw alloc-type countAllLayer2C1|S5|L1P1>show bandwidth allocationBandwidth allocation type:countAllLayer2Ingress rate:unLimitEgress rate:unLimitC1|S5|L1P1>

Note: this command is not supported on all models.

DMI Commands

These commands are used for Diagnostic Monitoring Interface (DMI) operations. **Note**: These commands can only be entered for a fiber port that supports DMI. Not all SFPs support DMI. If you enter a DMI command on a port with an SFP that does not support DMI, the message "*The DMI feature is not supported on current port*." displays.

Show DMI Configuration

Syntax: show dmi info		
Description: Displays the configuration of the Diagnostic Monitoring Interface (DMI).		
Example:		
Agent III C1 S3 L1P1> show dmi info		
Error: DMI is only supported on FIBER p	ort!	
Agent III C1 S3 L1P1>go l1p=2

Diff Receive power fill daton chreshold.	V un	

Agent III C1|S3|L1P2>

Set DMI Receive Power Preset Level

Syntax: set dmi rx-power-preset-level=<xx>

Description: Sets the lowAlarm threshold for RxPowerAlarm. If a non-zero value (in microwatts) is specified, the module will stop passing traffic when the receive power drops below the new threshold. This feature is sometimes referred to as Intrusion Detection, since tapping into a fiber to intercept traffic leads to a reduction in receive power.

Sets the Diagnostic Monitoring Interface (DMI) receive preset power level.

where:

xx = Pwr-val: A preset level for Rx Power on the Fiber port (1-100).

Example:

Exumple.	
Agent III C1 S3 L1P2> set dmi rx-power-p Agent III C1 S3 L1P2> show dmi info Diagnostic monitoring interface informa

NID models with Diagnostic Monitoring Interface (DMI) support allow diagnosing problems within the network. The DMI function displays x3220 NID diagnostic / maintenance information such as fiber interface characteristics, diagnostic monitoring parameters, and supported fiber media lengths. All DMI events will trigger notification. Intrusion detection, based on Rx Power level, is available for triggering any drop in the Rx power.

DMI devices display four main functions: Transmit power, Receive power, Transmit bias current, and Temperature.

Within each function, the DMI device will send a trap whenever a high or low warning event or high or low alarm event occurs (for a total of 16 traps). If both the local and remote NIDs are DMI models, the DMI device will indicate whether the trap event is from a local or remote device.

The DMI parameters are explained below.

Parameter	Associated MIB variable	Description		
Interface Cha	Interface Characteristics			
DMI ID	ionDMIId(8)	Specifies the physical DMI device ID from the standard; for example: SFP/SFP+/SFP28, SG, Optical pigtail, SFP, 300-pin XBI, XENPAK, XFP, XFF, XFP-E, XPAK, X2, DWDM-SFP/SFP+, QSFP, QSFP+, CXP, Copper Pigtail, RJ45 (Registered Jack), No separable connector, etc.		
Connector Type	ionDMIConnectorType(1)	The external optical or electrical cable connector provided as the interface. For example: LC, SC, Dual BNC coax connectors, DB9 for RS232 and RS485, RJ-11, unshielded twisted pair, SC fiber, 1550nm 40km, SC fiber, 1 x 9, 125km Gigabit , ST Single-Fiber 155Mbps, LC Multimode Fiber, SFP cage, Single-Fiber Multimode, SC Multimode (long haul), LC Singlemode (long haul), XFP slot, SFP+ slot, etc		
Nominal Bit Rate (Mbps)	ionDMIBitRate(2)	Bitrate in units of 100Mbps (for example: 10500, or 10.G Gbps) (measured rate).		
Fiber Interface Wavelength (nm)	ionDMILaserWavelength(9)	The Nominal transmitter output wavelength at room tem- perature (measured wavelength). The unit of measure is nanometers (for example: 1550 nm or 850 nm).		
Diagnostic M	onitoring			
		Receive power (measured power measurement) on local fiber measured in microwatts (for example: 11 uW).		
Receive Power (dBM)	ionDMIRxPowerLevel(16)	Receive power (measured signal strength) on local fiber measured in dBM (decibels relative to one milliwatt) which defines signal strength. For example: -19.586 dBM.		
Receive Power Alarm ionDMIRxPowerAlarm(17) Alarm - 3, High Warn - 4, Low Alarm - 6 High Alarm - 7		Not Supported - 2, Low Warn - 3, High Warn - 4, Low Alarm - 6		
Threshold ionDMIRxPwrLvIPreset(18) read value falls below the preset value,		A preset level for Rx Power on the Fiber port. If the DMI read value falls below the preset value, an intrusion is detected, and a trap is generated (0-10). The message		

Table 31: DMI Parameters

Parameter	Associated MIB variable	Description
		displays: ALARM: Receive power is below specified threshold. Fiber trap intrusion may be in progress. Note : C4110 port 2 DMI data is not shown if there is no SFP in port 1. Without an SFP in port 1, the port 2 DMI will display "The DMI feature is not supported on the cur- rent port.". When an SFP is inserted into port 1, the port 2 DMI displays as expected. To recover, insert an SFP in Port 1 and click the Refresh button.
Temperature (°C)	ionDMITemperature(10)	Measured temperature of fiber transceiver in tenths of de- grees C (Celsius). For example: 30.1°C.
Temperature (°F)	ionDMITemperature(10)	Measured Temperature of fiber transceiver in tenths of degrees F (Fahrenheit). For example: 86.2 °F.
Temperature Alarm	ionDMITempAlarm(11)	Alarm status for temperature of fiber transceiver. An <i>ionDMITemperatureEvt</i> event is sent when there is a warning or alarm on DMI temperature. Normal -1, Not Supported - 2, Low Warn - 3, High Warn - 4, Low Alarm - 6 High Alarm - 7
Transmit Bias Current (uA)	ionDMITxBiasCurrent(12)	Measured transmit bias current on local fiber interface, in uA (microamperes). For example, 5936 uA (microamps).
Transmit Bias Alarm	ionDMITxBiasAlarm(13)	Alarm status for transmit bias current on local fiber inter- face. Normal -1, Not Supported - 2, Low Warn - 3, High Warn - 4, Low Alarm - 6 High Alarm - 7
Transmit Power (uW)	ionDMITxPowerLevel(14)	Measured transmit power on local fiber measured in mi- crowatts.For example, 240 uW (microwatts).
Transmit Power (dBM)	ionDMITxPowerLevel(14)	Transmit power on local fiber measured in dBM (decibels relative to one milliwatt) which defines signal strength. For example: -2.291 dBM.
Transmit Power Alarm	ionDMITxPowerAlarm(15)	Alarm status for transmit power on local fiber. Normal -1, Not Supported - 2, Low Warn - 3, High Warn - 4, Low Alarm - 6 High Alarm - 7
Supported Me	edia Length	
9/125u Single- mode Fiber (km)	ionDMILenFor9x125umKM(3)	Specifies the link length that is supported by the trans- ceiver while operating in single mode (SM) fiber. The unit of measure is kilometers (km). For example, 8Km.
9/125u Single- mode Fiber (m)	ionDMILenFor9x125umM(4)	Specifies the link length that is supported by the trans- ceiver while operating in single mode (SM) fiber. The unit of measure is meters (m). For example, 80m.

Parameter	Associated MIB variable	Description	
50/125u Multi- mode Fiber (m)	ionDMILenFor50x125um10M(5)	Specifies the link length that is supported by the trans- ceiver while operating in 50 micron Multimode (MM) fiber. The value is in meters.	
62.5/125u Mul- timode Fiber (m)	ionDMILenFor625x125um10M(6)	Specifies the link length that is supported by the trans- ceiver while operating in 62.5 micron Multimode (MM) fi- ber. The value is in meters.	
Copper (m)	ionDMILenForCopper(7)	Specifies the link length that is supported by the trans- ceiver while operating in copper cable. The value is in me- ters.	
Vendor Speci	ific Information		
Vendor Name	ionDMIInfoEntry 19	A 16 character field that contains ASCII characters. The full name of the corporation, a commonly accepted abbreviation of the name of the corporation, the SCSI company code for the corporation, or the stock exchange code for the corporation. For example: Transition or other.	
Vendor Part Number	ionDMIInfoEntry 20	A 16-byte field that contains ASCII characters, defining the vendor part number or product name. A value of all zeroes in the 16-byte field indicates that the vendor PN is unspecified. For example, TN-SFP-LX1, TN-SFP-BXD, TN-SFP-OC3M, TN-SFP-OC3S, TN-10GSFP-SR or simi- lar. For the TN-DWDM-SFP-xxxx, the xxxx indicates the center wavelength (e.g., for a TN-DWDM-SFP-5012, the 5012 indicates 1550.12 nm center wavelength laser sup- port).	
Revision	ionDMIInfoEntry 21	A 4-byte field that contains ASCII characters, defining the vendor product revision number. A value of all zeroes in the 4-byte field indicates that the vendor revision is unspecified. For example e.g., 2.0.	
Serial Number	ionDMIInfoEntry 22	A 16 character field that contains ASCII characters, defin- ing the vendor's serial number for the transceiver. A value of all zeroes in the 16-byte field indicates that the vendor SN is unspecified. For example: TWDW34Z001, 8800022, 102201102, or similar.	
MFG Date Code	ionDMIInfoEntry 23	An 8-byte field that contains the Vendor's date code in ASCII characters: 84-85 ASCII code, two low order digits of year (00 = 2000). 86-87 ASCII code, digits of month (01 = Jan through 12 = Dec). 88-89 ASCII code, day of month (01-31). 90-91 ASCII code, vendor specific lot code, may be blank. For example 2016-07-30.	
Transceiver Type	tnDMIInfoEntry xx	The SFP transceiver type. For example: None, Not Supported, SFP 100FX, SFP 1000BASE-T, SFP 1000BASE-CX, SFP 1000BASE-SX, SFP 1000BASE-LX, SFP 1000BASE-X, SFP 2G5, SFP 5G, or SFP 10G.	
Vendor OUI	tnDMIInfoEntry 25	The vendor Organizationally Unique Identifier field (Ven- dor OUI) is a 3-byte field that contains the IEEE Company Identifier for the vendor (e.g., 00-C0-F2). A value of all zeroes in the 3-byte field indicates that the Vendor OUI is unspecified.	

Dot1bridge Commands

The following dot1bridge commands are used to add, remove, set, and show dot1bridge functions (reference RFC 1493, "Definitions of Managed Objects for Bridges"). **Note**: These commands can only be entered at the device level - when the last part of the command line prompt indicates the location is a device (L1D, L2D or L3D).

Set Dot1bridge Aging Time

Syntax: set dot1bridge aging-time=<xx>

Description: Defines the aging time of a bridge.

The aging time is the number of seconds a MAC address will be kept in the forwarding database after having received a packet from this MAC address. The entries in the forwarding database are periodically timed out to ensure they do not stay around forever.

where:

Aging Time for how long (from 0-3825 seconds) entries are to remain in the forwarding database (FDB) of the switch, in 15 second increments (e.g., 15, 45, 300 seconds, etc.). The default is 300 seconds. The valid range is 0– 3825 seconds (0 - 63.75 minutes).

Example: C1|S3|L1P2>set dot1bridge aging-time=15
C1|S3|L1P2>set dot1bridge aging-time=0
C1|S3|L1P2>set dot1bridge aging-time ?
<0-3825>

Note: Setting too short an aging time can cause addresses to be prematurely removed from the table. Then when the switch receives a packet for an unknown destination, it floods the packet to all ports in the same VLAN as the receiving port. This unnecessary flooding can impact performance. Setting too long an aging time can cause the address table to be filled with unused addresses, which prevents new addresses from being learned.

Note: While the x222x & x32xx can learn up to 8192 entries, there is a limit of 1000 entries that it can manage via the Web/CLI/FP interfaces. So even if the NID learns more than 1000 entries, only 1000 entries (including static entries) can be displayed/managed though the x222x & x32xx interface (as limited by x222x & x32xx memory space and CPU capability).

Show Dot1bridge Aging Time

Syntax:	show dot1bridge aging-time		
Description:	Displays the aging time for a dot1bridge.		
Example:	C1 S13 l0d/> show dot1bridge aging-time		
	Dot1bridge aging time:	60	

Dot1dbridge Commands

The following Dot1dbridge commands are used to add, remove, set, and show dot1dbridge functions (reference the IEEE 802.1d standard).

Note: These commands can only be entered at the device level - when the last part of the command line prompt indicates the location is a device (L1D, L2D or L3D).

Set Dot1dbridge IEEE Tag Priority			
Syntax:	set dot1dbridge ieee-tag-priority= <x> remap-priority=<y></y></x>		
Description:	Defines the IEEE 802.1d tagging priority and remapping priority to be used for the NID.		
	where:		
	x=<0-7> y=<0-3>		
Example:	C1 S5 L1D> set dot1dbridge ieee-tag-priority=4 remap-priority=3 C1 S5 L1D		

Set Dot1dbridge IP Priority Index

Syntax:	set dot1dbridge ip-priority-index=x		
Description:	Defines the IEEE 802.1d IP priority index to be used for the NID.		
	where: x = <0-63>		
Example:	C1 S5 L1D> set dot1dbridge ip-priority-index=9 remap-priority=2 C1 S5 L1D>		

Show Dot1dbridge IEEE Tag Priority Remapping

Syntax: show dot1dbridge ieee-tag priority remapping

Description: Displays the current IEEE 802.1d tag priority index and remapping priority configuration of the NID.

Example:	C1 S5 L1D> show dot1dbridge ie	ee-tag priority remapping	
	IEEE priority-index	remapping-priority	
	0	0	
	1	0	
	2	1	
	3	1	
	4	2	
	5	2	
	6	3	
	7	3	
	C1 S5 L1D>		

Show Dot1dbridge IP-TC Priority Remapping

Syntax:	show dot1dbridge ip-tc priority remapping
---------	---

Description: Displays the current IEEE 802.1d priority index, traffic class and remapping priority configuration of the NID.

Example:		t 1dbridge ip-tc pri traffic class	ority remapping remapping-priority	
	0	0	0	
	1	4	0	
	2	8	0	
	3	12	0	
	4	16	0	
	5	20	0	
	6	24	0	
	7	28	0	
	8	32	0	
	9	36	0	
	10	40	0	
	::	::	:	
	60	240	3	
	61	244	3	
	62	248	3	
	63	252	3	
	C1 S5 L1D>			

Ethernet Port Commands

The following commands are used for Ethernet port operations. The functions of some of the Ethernet port commands below depend on the type of port, as shown in the "Port Type" column in the table below.

Note: These commands can only be entered when the last part of the command line prompt indicates the location is a port (LxPx; where x is 1, 2 or 3). An asterisk * indicates Read only (ON) capability.

	Port Type					
Feature	10/100/1000 BaseT	100 BaseFX	1000 BaseX	SGM II		
Advertised Capabilities	V					
AutoCross						
Auto Negotiation			*	*		
Cable Length						
Duplex	V	\checkmark				
Far End Fault (FEF)		\checkmark	\checkmark			
Layer 2 Control Protocol (L2CP)	N	\checkmark	\checkmark	\checkmark		
Loopback		\checkmark	\checkmark			
Pause	V	\checkmark				
PHY mode		\checkmark	\checkmark	\checkmark		
Speed	\checkmark					

Clear Ethernet Port Counters

Syntax:	clear ether all counters	
Description:	Clears the Ethernet port counters on a NID. The port's counts (RMON statistics counters, dot3 counters, etc.) are reset to zero.	
Example:	C1 S5 L1D>go l1p=1	
	C1 S5 L1P1> clear ether all counters	
	C1 S5 L1P1>go l1p=2	
	C1 S5 L1P2> clear ether all counters	
	C1 S5 L1P2>	

Note: Use the **show ether statistics** command to display the current Ethernet port counter information.

Clear All Ports Counters

Syntax:	reset all ports counters
Description:	Resets all counters on all ports of the specified Ethernet device. The device's counts (RMON statistics counters, dot3 counters, etc.) are reset to zero and begin incrementing immediately.
Example:	C1 S5 L1D> reset all ports counters C1 S5 L1D>

Note: Use the show ether config command to show the current Link operation status.

Set Ethernet Port Admin Status

Syntax:	set ether admin state={up down}
Description:	Specifies whether or not the Ethernet port is available for use.
Example:	C1 S3 L1P2> set ether admin state ?
	down up
	C1 S5 L1P2> set ether admin state up C1 S5 L1P2>

Note: Use the show ether config command to show the current Link operation status.

Set Ethernet Port Advertisement Capability

Syntax: set ether adv–cap=<xx>

Description: Specifies the linking capability to be auto-negotiated for this Ethernet copper port.

The auto-negotiate feature must be enabled for this command to have any affect (see "Set Ethernet Port Auto-Negotiation Status" on page 31). In addition to the speed and duplex function, the port also advertises whether it supports pause frames (see "Set Ethernet Port Pause Frames" on page 33).

Where:

- xx = valid choices are:
 - **10TFD** (TP port 10 Mbps full duplex)
 - 10THD (TP port 10 Mbps half-duplex)
 - 100TFD (TP port 100 Mbps full duplex)
 - **100THD** (TP port 100 Mbps half-duplex)
 - 1000TFD (TP port 1000 Mbps full duplex)
 - **1000THD** (TP port 1000 Mbps half-duplex)
 - **1000XFD** (Fiber port 1000 Mbps full duplex)
 - **1000XHD** (Fiber port 1000 Mbps half-duplex)

To specify more than one capability use a plus sign (+) between entries (e.g., adv-cap=10TFD+100TFDl+1000THD)

```
Example:
             C1|S16|L1D>set ether adv-cap 1000XHD
             Error: this command should be executed on a port!
             C1|S16|L1D>go l1p=1
             C1|S16|L1P1>set ether adv-cap 1000XHD
             Bad advertisement capability!
             C1|S16|L1P1>set ether adv-cap 100FXD
             Bad advertisement capability!
             C1 S16 L1P1>set ether adv-cap 100TFD
             C1|S16|L1P1>go l1p=2
             C1|S16|L1P2>set ether adv-cap 100TFD
             Bad advertisement capability!
             C1|S16|L1P2>
             C1|S16|L1P2>set ether autoneg state enable
             Cannot set auto-negotiation state on this port!
             C1|S16|L1P2>go l1p=1
             C1|S16|L1P1>set ether autoneg state enable
             C1|S16|L1P1>set ether adv-cap 10TFD
             C1|S16|L1P1>
```

Set Ethernet Port *AutoCross*

Syntax:	set ether autocross= <xx></xx>	
Description:	Defines whether the cabling for this Ethernet port is cross-over or straight through, or whether the system will automatically adjust as needed. Lantronix recommends leaving AutoCross in default mode (auto).	
	where:	
	xx = valid choices are:	
	 auto – automatically correct errors in cable selection (default – recommended) 	
	 mdi – transmit pair on one end of the cable is connected to the receive pair on the other end 	
	 mdi-x – straight through cable (transmit to transmit/receive to receive) 	
Example:	C1 S5 L1P2> set ether autocross mdi Cannot set autocross on Fiber port! C1 S5 L1P2> go l1p=1	

Note: This command is only applicable on a copper port. Use the **show ether config** command to display the current auto-negotiation state.

Set Ethernet Port Auto-Negotiation Status

C1|S5|L1P1>set ether autocross mdi

Syntax:	set ether autoneg state={enable disable}
Description:	Defines whether the auto-negotiation feature is enabled or disabled for this Ethernet port.
	If enabled, speed and duplex information will automatically be exchanged over the link. The information that is advertised for this port is specified by the Set Ethernet Port Advertisement Capability command (page 49).
Example:	C1 S3 L1P2> set ether autoneg state=enable Cannot set auto-negotiation state on this port! C1 S3 L1P2> go l1p=1 C1 S3 L1P1> set ether autoneg state=enable C1 S3 L1P1>

Note: This command is only applicable on a copper port. Use the **show ether config** command to display the current auto-negotiation state.

Set Ethernet Port Duplex Mode

Syntax:	set ether duplex={full half}
---------	--------------------------------

Description: Defines whether the Ethernet port operates in full or half-duplex.

Example: C1|S5|L1P1>set ether duplex full C1|S5|L1P1>set ether duplex half C1|S5|L1P1>

Note: Use the show ether config command to display the current auto-negotiation state.

Set Ethernet Port Filter 802.1Q Tagged Non-Management Frames

<i>Syntax.</i> Set etner inter-unknown-unicast ={true faise	Syntax:	set ether filter-unknown-unicast={true	false}
--	---------	--	--------

Description: Defines whether 802.1Q tagged non-management frames can be transmitted/received through the Ethernet port.

802.1Q-compliant switch ports can be configured to transmit tagged or untagged frames. A tag field containing VLAN (and/or 802.1p priority) information can be inserted into an Ethernet frame. If a port has an 802.1Q-compliant device attached (such as another switch), these tagged frames can carry VLAN membership information between switches, thus letting a VLAN span multiple switches.

Example: C1|S5|L1P2>set ether filter-unknown-multicast=true C1|S5|L1P2>set ether filter-unknown-unicast=true C1|S5|L1P2>

Set Ethernet Port Filter 802.1Q Untagged Non-Management Frames

Syntax: set ether filter–unknown–multicast ={true | false}

Description: Defines whether 802.1Q untagged non-management frames can be transmitted/received through the Ethernet port.

802.1Q-compliant switch ports can be configured to transmit tagged or untagged frames. It is important to ensure ports with non-802.1Q-compliant devices attached are configured to transmit untagged frames. Many NICs for PCs and printers are not 802.1Q-compliant. If they receive a tagged frame, they will not understand the VLAN tag and will drop the frame.

Example: C1|S5|L1P2>set ether filter-unknown-multicast=true C1|S5|L1P2>set ether filter-unknown-unicast=true C1|S5|L1P2>

Set Ethernet Port LOAM Loopback Type

Syntax:	set ether loopback type= <xx></xx>	
Description:	Defines the type of loopback method on an Ethernet port.	
	where:	
	xx = loopback method; the choices are:	
	 alternate – allows the data frames to be forwarded to other ports, while doing the loopback with its peer. 	
	 noloopback – the port will not perform any loopback. 	
	 remote – Remote Peer – prevents that port from forwarding data frames to other ports when it goes into "loopback" mode (AKA "intrusive loopback" 	
Example:	AgentIII C1 S8 L1D>set ether loopback type ? alternate maclayer noloopback phylayer remote AgentIII C1 S8 L1D>set ether loopback type alternate Error: this command should be executed on a port! AgentIII C1 S8 L1D>go l1p=1 AgentIII C1 S8 L1P1>set ether loopback type alternate AgentIII C1 S8 L1P1>set ether loopback type maclayer Set Ethernet port loopback type failed. AgentIII C1 S8 L1P1>set ether loopback type noloopback AgentIII C1 S8 L1P1>set ether loopback type phylayer Set Ethernet port loopback type failed. AgentIII C1 S8 L1P1>set ether loopback type phylayer Set Ethernet port loopback type failed. AgentIII C1 S8 L1P1>set ether loopback type phylayer Set Ethernet port loopback type failed. AgentIII C1 S8 L1P1>set ether loopback type remote AgentIII C1 S8 L1P1>	

Note: Use the **show ether loopback state** command or the **show ether loopback capability** command to display the current loopback type settings.

Set Ethernet Port Pause Frames

Syntax: set ether pause=<xx>

Description: Defines whether the Ethernet port supports pause frames (data pacing). Pause frames are used as a method of flow control on full duplex Ethernet connections. If a sending device is transmitting data faster than the receiving device can accept it, the receiving station will send a pause frame to halt the transmission of the sender for a specified period of time.

Pause frames are only used on full duplex Ethernet link segments that are defined by IEEE 802.3x and use MAC control frames to carry the pause commands. Only stations configured for full duplex operation can send pause frames.

where:

xx = pause type; valid choices are:

- **nopause** (the port will advertise that is has no pause capabilities)
- **apause** (asymmetric; the port will advertise that it can only transmit pause frames)
- **bpause** (asym/sym; the port will advertise that it supports both asymmetric and symmetric capabilities
- **pause** (the port will advertise it has pause capability)
- **spause** (symmetric; the port will advertise that it can transmit and receive pause frames)

Example:

```
C1|S16|L1P1>set ether pause=pause
C1|S16|L1P1>set ether pause=nopause
C1|S16|L1P1>set ether pause=apause
Fail to set pause capability!
C1 S16 L1P1>set ether pause=bpause
Invalid pause value!
C1|S16|L1P1>set ether pause=spause
Invalid pause value!
C1|S16|L1P1>go l1p=2
C1|S16|L1P2>set ether pause=spause
C1|S16|L1P2>set ether pause=bpause
C1|S16|L1P2>set ether pause=apause
C1|S16|L1P2>set ether pause=nopause
C1|S16|L1P2>set ether pause=pause
Invalid pause value!
C1|S16|L1P2>
```

Note : Use the show ether config command to display the current pause capability and pause setting.

Set Ethernet Port Source MAC Address Lock

Syntax:	set ether src-addr-lock={true false}	
Description:	Defines whether or not there is a source N	IAC address lock for the Ethernet port.
	the switch port and allows only that MAC a other MAC address tries to communicate t	bers the Ethernet MAC address connected to address to communicate on the port. If any through the port, port security will take the ource MAC Address Lock Action command.
Example:	C1 S5 L1P2>set ether src-addr-lock C1 S5 L1P2>set ether src-addr-lock all discard discardandnotify shutdown C1 S5 L1P2>set ether src-addr-lock C1 S5 L1P2>set ether src-addr-lock	action ? action=discard action=discardandnotify action=shutdown action=all fig
	Source MAC address lock action: Filter unknown dest unicast:	enable all true true

Set Ethernet Port Source MAC Address Lock Action

Syntax: set ether src–addr–lock action=<xx>

Description: Defines the action to be taken when the MAC address lock feature is enabled through the Set Ethernet Port Source MAC Address Lock command.

where:

xx = valid choices are:

- discard (discard any transmissions received on the port)
- **discardandnotify** (discard any transmissions received on the port and send an SNMP trap to the trap server)
- **shutdown** (disables the port)
- all

Example: C1|S5|L1P2>set ether src-addr-lock=enable C1|S5|L1P2>set ether src-addr-lock action ? all discard discardandnotify shutdown C1|S5|L1P2>set ether src-addr-lock action=discard C1|S5|L1P2>set ether src-addr-lock action=discardandnotify C1|S5|L1P2>set ether src-addr-lock action=shutdown C1|S5|L1P2>set ether src-addr-lock action=all C1|S5|L1P2>show ether security config Ethernet port security configuration: Source MAC address lock: enable Source MAC address lock action: all Filter unknown dest unicast: true Filter unknown dest multicast: true C1|S5|L1P2>

Set Ethernet Port Speed

Syntax: **set ether speed**={10M | 100M | 1000M}

Description: Defines the transmission speed to be used on the Ethernet copper port. If Autonegotiation is enabled, you cannot set the port speed.

Example (<u>copper</u> port):

C1|S16|L1P1>set ether speed ? 1000M 100M C1|S16|L1P1>set ether speed 1000M Can not set 1000M speed for this card! C1|S16|L1P1>set ether speed 100M C1|S16|L1P1>set ether speed 10M

This command does <u>not</u> work on a <u>fiber</u> port.

Note: Use the show ether config command to display the current speed setting of an Ethernet port.

Show Ethernet Port Configuration

Syntax: show ether config

Description: Displays the Ethernet port configurations on a slide-in module.

Different ports have different capabilities, so the display content will vary according to the slide-in module type and port type.

Example 1: An example for a <u>TP Port</u> (copper port) is shown below.

Agent III C1 S1 L1P2> go c=1 s=9 l1p=1 Agent III C1 S9 L1P1> show ether config Port-11040 TP port:		
Link operation status: Admin status: Port mode: PHY operation mode: Speed: Duplex: Autocross: PHY mode change cap:	down up RJ-45 phy10-1000BaseT Negotiating Negotiating auto false	
AutoNeg admin state: Advertisement: Capability: Pause: Agent III C1 S9 L1P1>	enable 10THD+10TFD+100THD+100TFD+1000TFD nopause	
<i>Example 2</i> : An example of a <u>FI</u>	<u>BER port</u> (SFP port) is shown below.	
Agent III C1 S9 L1P1> go l1p= Agent III C1 S9 L1P2> show et Port-21040 FIBER port:		
Link operation status: Admin status: Port mode: PHY operation mode: Speed: Duplex: PHY mode change cap:	down up SFP Slot phy1000BaseX Negotiating Negotiating true	
AutoNeg admin state: Advertisement: Capability: Pause: Agent III C1 S9 11P2>	enable 1000XFD nopause	

Show Ethernet Port Loopback Capability

Syntax:	show ether loopback capability
Description:	Displays the loopback capability of the Ethernet port.
Example:	C1 S16 L1P1>show ether loopback capability Loopback capability: alternate remotePeer C1 S16 L1P1>go l1p=2 C1 S16 L1P2>show ether loopback capability Loopback capability: alternate remotePeer C1 S16 L1P2>

Note: The loopback capabilities that can be reported include alternate remotePeer, noloopback, and remote.

Show Ethernet Port Loopback Running Status

Syntax:	show ether loopback state
Description:	Displays the loopback running status of the Ethernet port.
Example:	C1 S16 L1P1> show ether loopback state
	Loopback type: noloopback
	Loopback state: noLoopback
	C1 S16 L1P1>go l1p=2
	C1 S16 L1P2>show ether loopback state
	Loopback type: noloopback
	Loopback state: noLoopback
	C1 S16 L1P2>

Note: The loopback states that can be reported include alternate, noloopback, and remote.

Show Ethernet Port Security Configuration

Syntax:	show ether security config		
Description:	Displays the security configuration for an Ethernet port.		
Example:	C1 S16 L1P1> show ether security config Ethernet port security configuration:		
	Source MAC address lock: Source MAC address lock action: Filter unknown dest unicast: Filter unknown dest multicast: C1 S16 L1P1>go l1p=2 C1 S16 L1P2>show ether security co Ethernet port security configurati	discardandnotify false false onfig	
	Source MAC address lock: Source MAC address lock action: Filter unknown dest unicast: Filter unknown dest multicast: C1 S16 L1P2>	discardandnotify false	

Show Ethernet Port TDR Test Configuration

ow ether tdr config

Description: Displays the Time Domain Reflectometry (TDR) test configuration for the Ethernet port. This command is only available for a copper port.

Example:	No TDR test result on FIBER port! C1 S16 L1P2>go l1p=1 C1 S16 L1P1>show ether tdr config		
	Time-domain reflectometer configuration:		
	TDR test state:	success	
	TDR test init time:	08:35:26	
	TDR test result valid: C1 S16 L1P1>	true	

Show Ethernet Port TDR Test Result

Syntax:	show ether tdr test result
---------	----------------------------

Description: Displays the results of an Ethernet port TDR test. This command is only available for a copper port.

Example:	C1 S18 L1P1> show et	her tdr test result	
	Cable pair :		
	index	distance to fault(unit)	status
	• • • •		
	pair1and2	unknown	unknown
	pair3and6	unknown	unknown
	pair4and5	unknown	unknown
	pair7and8	unknown	unknown
	C1 S18 L1P1>		

Note: Run the TDR test several times to ensure accurate results. Do not change port status (e.g., remove the cable at the near end or far end) as this may cause inaccurate results.

Show Ethernet Statistics

Syntax:	show ether statistics		
Description:	Displays Ether-like counters and If-MIB counters for a port. This command is not available on the IONMM or Power Supply.		
Example:	C1 S16 L1P1> show ether statistics Port Counters Received:		
	Total Octets: Unicast Packets: Broadcast Packets: Multicast Packets: Rx Discards: Rx Errors: Port Counters Sent: 	537241 0 4189 0 0 0 0 754674	
	Unicast Packets: Broadcast Packets: Multicast Packets: Rx Discards: Rx Errors: Dot3 Statistics:	0 0 11433 0 0	
	Alignment Errors: FCS Errors: SQE Test Errors: Deferred Frames: Internal MAC Tx Errors: Internal MAC Rx Errors: Carrier Sense Errors: Symbol Errors: Single Collisions: Multiple Collisions: Late Collisions: Excessive Collisions: Oversized Frames: Duplex Status: Rate Control Ability: Rate Control Status: MAC Control Frames:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	
	Rx Unknown Opcodes : Rx Pause Frames : Tx Pause Frames: C1 S16 L1P1>	0 0 0	
Start/Stop Ethernet Port Loopback Operation

Syntax: set ether loopback oper={init | stop}

Description: Defines whether a loopback test is to be initiated (init) or stopped (stop) on an Ethernet port. LOAM The loopback test can be used as an aid in detecting physical connection problems.

Example:	C1 S16 L1P1>set ether loopback oper ?
	init
	stop
	C1 S16 L1P1>set ether loopback oper init
	Admin state of Link OAM of this port is disable, please enable it first!
	C1 S16 L1P1>set ether admin state=up
	C1 S16 L1P1>set ether loopback oper init
	C1 S16 L1P1> set ether loopback oper stop

Note: LOAM must be enabled on both ends of the link, and LOAM mode must be set to active. The LOAM Admin state for this port must be set to **up** before this command will work. See the **set ether admin state** command.

This command puts a slide-in module in a special mode that enables the device to loop back the signal from the RX port to the TX port on either media for testing and troubleshooting purposes. Test signals from a tester (Firebird, etc.) can then be inserted into the link and looped back as received by a device to test a particular segment of the link (i.e., copper or fiber). Loopback can be either local or remote depending on the location of the converter in the link. Some slide-in modules have separate copper and fiber loopback functions that can be enabled separately, while others will loopback both copper and fiber at the same time when enabled.

Start Ethernet Port TDR Test

Syntax: start ether tdr test

Description: Starts a Time Domain Reflector (TDR) test on the Ethernet port. TDR is a method for determining the general characteristics of impedance variations in a transmission line. In this method a test pulse is transmitted down the line and the reflection from an impedance discontinuity is detected together with the time it takes for the pulse to reach the discontinuity and return. The location of the discontinuity is determined by observation of the elapsed time between the transmitted pulse and the reflected pulse.

This technique is highly sensitive, revealing not only gross defects, such as open or short circuited cables and terminations, but also revealing quite minute variations, e.g., cable impedance variations, frayed shields, and impedances introduced by making tap connections to the cable.

Example:	C1 S16 L1P1> start ether tdr test C1 S16 L1P1> show ether tdr test result Cable pair :			
	index .	distance to fault(unit)	status	
	pair3and6 pair4and5 pair7and8 C1 S16 L1P1> show et	· · · ·	open open open open	
	TDR test state: TDR test init time: TDR test result val C1 S16 L1P1>go l1p= C1 S16 L1P2>show et No TDR test result C1 S16 L1P2>	Lid: true =2 ther tdr config		

Use the show ether tdr test result command to display the TDR test results.

Use the **show ether tdr config** command to display the TDR test validity and init time.

Set L2CP Protocol Handling

```
Syntax: set I2cp protocol=<xx>process={pass/discard}
```

where:

xx = the particular L2CP protocol; the valid entries are:

- spanningTree Any STP/RSTP/MSTP protocol frame with a destination address (DA) of 01-80-C2-00-00-00 is discarded at this port or passed. Spanning Tree Protocols (STP) disposition handling of 802.1D Spanning Tree Protocol (STP), and Rapid Spanning Tree Protocol (RSTP, per IEEE 802.1w).
- slow Any LACP/LAMP protocol frames with DA of 01-80-C2-00-00-02 is discarded at this port or passed. Since this device pairs link OAM frames, these frames will not be forwarded or discarded. Provides handling of Slow Protocols, one of two distinct classes of protocols used to control various operating aspects of IEEE 802.3 devices; protocols such as LACP, with less stringent frequency and latency requirements.
- portAuthentication protocol frames with a DA of 01-80-C2-00-00-03 is discarded at this port or passed. Port Authentication Protocols disposition – handling of RA-DIUS, CHAP, EAP, EAPOL, PEAP, FCPAP, and/or other port authenticating protocols. Port authentication protocol frames with a destination address of 01-80-C2-00-00-03 are discarded at this port or passed.
- elmi E-LMI protocol frames with a DA of 01-80-C2-00-00-07 is discarded at this
 port or passed. Provides handling of Ethernet Local Management Interface (ELMI); a
 MEF 16 protocol between the service provider network and the customer equipment that lets the customer equipment communicate its status and service characteristics to the service provider network to ease deployment and servicing.
- **IIdp** LLDP protocol frames with a DA of 01-80-C2-00-00-0E which are not TN discovery LLDP frames are discarded at this port or passed. Provides handling of Link Layer Discovery Protocol (LLDP), a Layer 2 protocol defined by IEEE Standard 802.1AB-2005.
- **bridgeMgmt** Bridge Management protocol frames with a DA of 01-80-C2-00-00-10 are discarded at this port or passed. Provides handling of one of several protocols per IEEE 802, including Bridge Group Address (STP), IEEE Std. 802.3x Full Duplex PAUSE operation, Bridge Management Group Address, GMRP and GVRP.
- garpmrpBlock GARP/ GMRP Block of protocols disposition handling of GARP (Generic Attribute Registration Protocol) and GMRP (GARP Multicast Registration Protocol) per IEEE 802.1ak. GARP/GMRP traffic with destination address of 01-80-C2-00-00-20 to 01-80-C2-00-00-2F is discarded at this port or passed. Select 'Pass' (pass to an EVC for tunneling) or 'Discard' (discard at the UNI).
- bridgeBlockOtherMulticast Passes or discards all of the IEEE multicast frames in the bridge block of addresses [01-80-C2-00-00-04 to 01-80-C2-00-00-0F]. Applies to all addresses in this block that are not covered by the other MIB variables in this table (i.e., this is not applicable for STP, slow protocols, etc.).
- Description: Sets the current Layer 2 Control Protocol processing configuration. Layer 2 Control Protocol processing (L2CP) is supported, allowing each of the layer 2 control protocols to be passed or discarded. Layer 2 Control Protocol Processing is supported at the per-port level. By default, all of the L2CP protocols are set to "pass".

Example: Agent III C1|S9|L1P1>set l2cp proto ? spanningTree slow portAuthentication elmi lldp bridgeMgmt garpmrpBlock bridgeBlockOtherMulticast Agent III C1|S9|L1P1>set l2cp proto Agent III C1|S9|L1P1>set l2cp proto=portAuthentication process=discard Agent III C1|S9|L1P1>set l2cp proto=elmi process=discard Agent III C1|S9|L1P1>set l2cp proto=lldp process=discard Agent III C1|S9|L1P1>set l2cp proto=bridgeMgmt process=discard Agent III C1|S9|L1P1>

L2CP LLDP Pass / Discard Function Not Supported

The previously supported L2CP LLDP frame forwarding 'pass or discard' function is no longer supported after version 1.3.0. All of the other L2CP protocols are still supported. It is set to "pass" "slow protocols" by default, but does not allow passing "01:80:C2:00:00:02" data.

For frames whose destination address is 01-80-C2-00-00-02, ION only allows LACP/LAMP protocol frames to pass. Per the standard MIB definition:

Name: ionIfL2CPSIowProtocolsFwd Type: OBJECT-TYPE OID: 1.3.6.1.4.1.868.2.5.3.1.2.7.1.2 Full path: iso(1).org(3).dod(6).internet(1).private(4).enterprises(1).transition(868).products(2).tnION-Products(5).tnIonMgmtMIB(3).tnIonMgmtObjects(1).ionInterfaceMgmt(2).ionIfL2CPTable(7).ionIfL2CPEntry(1).ionIfL2CPSIowProtocolsFwd(2) Module: TN-ION-MGMT-MIB

Parent: ionIfL2CPEntry Prev sibling: ionIfL2CPSTPProtocolsFwd **Next sibling**: ionIfL2CPPortAuthProtocolFwd

Numerical syntax: Integer (32 bit) Base syntax: INTEGER Composed syntax: INTEGER Status: current Max access: read-write Value list: 1: pass(1) 2: discard(2) 3: notApplicable(3).

Description: Any LACP/LAMP protocol frames with destination address of 01-80-C2-00-00-02 is discarded at this port or passed. Since this device pairs link OAM frames, these frames will not be forwarded or discarded.

Note: Currently the ION x2x2x/3x2x/3x3x SICs will only process the lldp from x2x2x/3x2x/3x3x SICs.

Show Ethernet Port L2CP Configuration

Syntax: show l2cp config

Description:Displays the current Layer 2 Control Protocol processing configuration. Layer 2 Control
Protocol processing (L2CP) is supported, allowing each of the layer 2 control protocols
be passed or discarded. Layer 2 Control Protocol Processing is supported at a per port
level.

Example:	Agent III C1 S4 L1P2> show l2cp config	
	Parameter	Value
	Spanning Tree Protocols	pass
	Slow Protocols	pass
	Port Authentication Protocols	pass
	ELMI Protocols	pass
	LLDP Protocols	pass
	Bridge Mgmt Protocols	pass
	GARP/GMRP Block of Protocols	pass
	Bridge Block Other Multicast Protocols	pass
	Agent III C1 S4 L1P2>	

Set Port Admin Mode (Ethernet PHY Mode)

Syntax: set ether phymode Description: Sets the Ethernet PHY mode for a Fiber port which is capable of changing PHY mode. where: xx = port admin mode (SGMII | 100BaseFX | 1000BaseX); the valid choices are: phy1000BaseX phy100BaseFX phySGMII *Example*: Agent III C1|S9|L1P1>set ether phymode=phy1000BaseX Error: Cannot set PHY mode on this port! Agent III C1|S9|L1P1>go l1p=2 Agent III C1|S9|L1P2>set ether phymode=phy1000BaseX Agent III C1|S9|L1P2>show ether config Port-21040 FIBER port: Link operation status: down Admin status: up SFP Slot Port mode: PHY operation mode: phy1000BaseX Speed: Negotiating Duplex: Negotiating PHY mode change cap: true AutoNeg admin state: enable Advertisement: 1000XFD Capability: Pause: nopause Agent III C1|S9|L1P2>

Note: use the **show ether config** command to display the current status (PHY mode change cap and PHY operation mode).

Note:

- The SFP port in 100BaseFx mode is set at 100Mbps with Duplex mode configurable. Far End Fault (FEF) is supported in this mode.
- The SFP port in 1000BaseX mode always has Auto-negotiation mode and Auto-negotiation Bypass mode enabled. Flow control is configurable in this mode.
- The SFP port operates in SGMII mode with Auto-negotiation always on. The Pause function is not available in SGMII Mode.

The default is 1000BaseX.

Show TP port cable length

Syntax:	show cable length
Description:	Displays the TP (copper) port cable length of the specified x2110 NID.
Example:	C1 S12 L1P1> show cable length Cable length: N/A (no cable/broken/>140 meters) C1 S12 L1P1>

The Cable lengths returned can include:

- <20 meters
- >20 meters and <40 meters
- >40 meters and <60 meters
- >60 meters and <80 meters
- >80 meters and <100 meters
- >100 meters and <120 meters
- >120 meters and <140 meters
- N/A (no cable/broken/>140 meters)

Note: Not all NIDs support this command. If this command is entered on an unsupported NID, the message "*Cannot show TP port cable length on this card*!" displays. See "Appendix C: CLI Messages and Recovery" on page 257.

Forwarding Database Commands

The following commands are used to add, remove, set, and show fwddb (forwarding database) functions and parameters.

Note: These commands can only be entered at the device level - when the last part of the command line prompt indicates the location is a device (L1D, L2D or L3D).

Add Forwarding Database Entry

Syntax: add fwddb mac=<ww> [conn–port=<xx>] [priority=<yy>] [type=<zz>]

Description: Adds a new entry in the forwarding database.

where:

- ww = MAC address
- xx = optional; connection port number (factory default is 1)
- yy = optional; priority of the entry (factory default is 0)
- zz = optional; state of this unicast or multicast entry (factory default is static); valid choices are:
 - static
 - staticNRL
 - staticPA

Example:

C1|S16|L1D>add fwddb mac 00-c0-f2-21-02-b3 conn-port=1 priority=7 type=static C1|S16|L1D>

Note: A Static Non Rate Limit (staticNRL) entry must have a multicast MAC address.

FDB Entry Type Notes: The Entry state of this unicast or multicast entry, {static, staticNRL, staticPA, dynamic}:

static – a Valid entry that does not age.

staticNRL – a static entry that has no ingress rate limiting (multicast entry only).

staticPA – a static entry that has priority override enabled.

A unicast entry can be static or staticPA, but not staticNRL. For MAC addresses that are learned, a readonly value of dynamic entry is returned.

Remove a Single Forwarding Database Entry

Syntax:	remove fwddb mac= <xx> fdbid=<yy></yy></xx>
Description:	Removes an entry from the forwarding database.
	where:
	xx = MAC address
	yy = forwarding database ID number (0–255)
Example:	C1 S16 L1D> remove fwddb mac 00-c0-f2-21-02-b3 fdbid 1 C1 S16 L1D>

Remove All Forwarding Database Entries

Description: Removes all entries from the forwarding database.

Example:	C1 S16	L1D>remove	fwddb	all
	C1 S16	L1D>		

Set Forwarding Database Connection Port

Syntax:	set fwddb mac= <xx> fdbid=<yy> conn-port=<zz></zz></yy></xx>
Description:	Sets the connect port of a row in the forwarding database.
	where:
	xx = MAC address
	yy = index of forwarding database index
	zz = index of the logical port from which the device received
Example:	C1 S16 L1D> set fwddb mac 00-c0-f2-21-02-b3 fdbid=3 conn-port=2 C1 S16 L1D>

Set Forwarding Database Entry Type

Syntax:	set fwddb mac= <xx> fdbid=<yy> type=<zz></zz></yy></xx>
Description:	Defines the entry type for the forwarding database.
	where:
	xx = MAC address
	yy = index number in the forwarding database
	zz = state of this unicast or multicast entry
	; valid choices are:
	• static
	• staticNRL
	• staticPA
	• dynamic
Example:	C1 S16 L1D> set fwddb mac=01-11-11-11-11 fdbid=1 type=static C1 S16 L1D>

Set Forwarding Database Priority

Syntax:	set fwddb mac= <xx> fdbid =<yy> priority=<zz></zz></yy></xx>	
Description:	<i>ription:</i> Defines the connect port of a row in forwarding database.	
	where:	
	xx = MAC address	
	yy = index number in the forwarding database	
	zz = priority of the entry	
Example:	C1 S16 L1D> set fwddb mac 00-c0-f2-21-02-b3 fdbid=3 priority=5 C1 S16 L1D>	

Set Forwarding Portlist

Syntax:	set fwd portlist= <xx></xx>
Description:	Defines the forwarding port list.
	where: xx = (0,1,2)
Example:	C1 S16 l1p1/> set fwd portlist=1,2 C1 S16 l1p1/>

Note: This command can only be entered at the port level – when the last part of the command line prompt indicates the location is a port (LxPx; where x is 1 or 2).

Use the **show fwd portlist** command to display the current configuration.

Set Forwarding Port Management Access

Syntax:	set port mgmtaccess={enable disable}
Description:	Enables/disables forwarding port management.
Example:	C1 S16 L1P1> set port mgmtaccess enable C1 S16 L1P1> set port mgmtaccess disable C1 S16 L1P1>

Note: This command can only be entered at the port level – when the last part of the command line prompt indicates the location is a port (LxPx; where x is 1, 2 or 3).

Show Forwarding Database (FDB) Configuration

Syntax: show fwddb config fdbid=<xx>

Syntax: Displays the configuration of forwarding database. Displays all dot1bridge MAC entries and related information for the NID in the location shown in the command line prompt. If the forwarding database is not yet configured, the message "*No data in VLAN forward database table now*!" displays.

where:

xx = MAC address of the dot1bridge

Example 1:

C1 S13 l0d/> show fwddb config fdbid=0				
Index	K MAC	connect-port	priority	type
1	00-C0-F2-02-03-0a	3	1	static
2	00-C0-F2-02-03-01	4	2	dynamic

Example 2:

C1 S12	L1D> show fwd	db config fd	bid 0		
index	MAC	connec	t port priority	type	
1	00-00-74-9d	-d1-76 1	0	dynamic	
2	00-02-b3-e9	-91-1e 1	0	dynamic	
3	00-04-75-d0	-0d-fe 1	0	dynamic	
4	00-04-75-dc	-57-9b 1	0	dynamic	
5	00-04-75-dc	-5c-2e 1	0	dynamic	
6	00-0b-cd-3f	-27-16 1	0	dynamic	
7	00-0e-0c-4b	-a2-63 1	0	dynamic	
8	00-10-4b-1f	-bd-7e 1	0	dynamic	
9	00-11-0a-ca	-a0-1a 1	0	dynamic	
10	00-11-0a-f5	-43-c7 1	0	dynamic	
11	00-11-11-59	-a0-23 1	0	dynamic	
12	00-13-fa-01	-17-6e 1	0	dynamic	
C1 S12	L1D>				

Note: If the forwarding database is not yet configured, the message "*No data in VLAN forward database table now*!" displays.

Show Forwarding Database Ports

Syntax:	show fwd portlist		
Description:	Displays the forwarding (fwd) port list of a device port.		
Example:	C1 S16 L1P1> show fw port-id	d portlist fwd portlist	mgmt access
	1 C1 S16 L1P1>	2	enable

Note: This command can only be entered at the port level - when the last part of the command line prompt indicates the location is a port (LxPx; where x is 1, 2 or 3).

Syntax:

HTTPS Commands

For a description on how to configure the ION Management Module for Hypertext Transfer Protocol Secure (HTTPS) see "Configuring HTTPS" on page 43).

Note: These commands can only be entered at the device level - when the last part of the command line prompt indicates the location is a device (L1D, L2D or L3D).

The following commands are used for HTTPS operations.

set https certificate-file=<name>

Set HTTPS Certificate File

Description: Defines the name of the file containing the certificate(s) used for HTTPS operations.

Set HTTPS Certificate Type

Syntax: **set https certificate-type**={authorized | self-certificate}

Description: Defines whether the certificate is from an authorized certificate vendor or is self-defined.

Example: C1|S5|L1D>set https certificate-type ?
 authorized
 self-certificate
C1|S5|L1D>set https certificate-type=authorized
C1|S5|L1D>set https certificate-type=self-certificate
C1|S5|L1D>

Set HTTPS Port Number

Syntax: set https port=<xx>

Description: Defines a port number that is different from the standard port number (443) that is to be used for HTTPS operations.

 Example:
 C1|S5|L1D>set https port=442

 C1|S5|L1D>show https config

 HTTPS configuration:

 HTTPS state:
 disable

 HTTPS port:
 442

 HTTPS certificate file:
 scrob

 HTTPS private key file:
 C1|S5|L1D>

Set HTTPS Private Key File

Syntax: set https private-key file=<xx>

Description: Defines the name of the file containing the private key used for HTTPS operations.

 Example:
 C1|S5|L1D>set https private-key file=privkeyfile

 C1|S5|L1D>show https config

 HTTPS configuration:

 HTTPS state:
 disable

 HTTPS port:
 442

 HTTPS certificate file:
 scrob

 HTTPS private key file:
 privkeyfile

 C1|S5|L1D>

Set HTTPS Private Key File Password

Syntax: set https private–key password

Description: Interactive command used to define the HTTPS private key password. After entering this command you will be prompted to enter the password. You will then be prompted to re-enter the password.

Set HTTPS State

Syntax: **set https state**={enable | disable}

Description: Enables or disables HTTPS.

Enabling HTTPS has no effect on either the USB or Telnet interface. However, access through the Web interface must go through HTTPS authentication after HTTPS is enabled.

Example: Agent III C1|S13|L1P2>set https state enable
Error: this command should be executed on a device!
Agent III C1|S13|L1P2>go l1d
Agent III C1|S13|L1D>set https state enable
Agent III C1|S13|L1D>

Show HTTPS Configuration

Syntax: show https config

Description: Displays all HTTPS configurations.

Start HTTPS Certificate Operation

Syntax: start https certificate

Description: Starts the HTTPS certificate operation.

This command requires that HTTPS is enabled, the certificate type is defined, the certificate file is defined, a private key file defined, and a password defined.

Example:AgentIII C1|S16|L1D>start https certificateAgentIII C1|S16|L1D>

IP / DNS / DHCP Commands

The x222x/32xx supports IPv4- and IPv6-based application protocols. The x222x/32xx can be assigned IP address statically or dynamically using DHCP. The x222x/32xx supports DNS, which lets you assign it a hostname instead of an IP address.

The ION software supports IPv4/IPv6 dual protocol stacks, which allows IPv4 and IPv6 to co-exist in the same devices, in the same physical interface, and in the same networks. IPv4 is a basic feature that is always enabled, but the IPv6 is an enhanced feature that you can disable and enable. When IPv6 is disabled, the configurations related to IPv6 will exist, but will not function. These configurations can be changed or removed by the user.

The ION software supports multiple DHCP or DHCPv6 or Stateless (Router) servers. In the scenarios below, ION will get one IP addresses (the first one to arrive to ION) and all router information

The static IP address assignment is part of the initial x222x/32xx setup, and at first the CLI (command line interface) is used to configure the IP address settings. Thereafter, remote management and/or DHCP addressing can be configured.

The default values are IP Address = 192.168.0.10, Subnet Mask = 255.255.255.0, Default Gateway = 192.168.0.1, with no DNS address assigned, and no DHCP client enabled. When manually setting the x222x/32xx NID's IP address, it can only be given a Class A, Class B or Class C address; it cannot be given a multicast or reserved IP address. The multicast addresses, loopback addresses, and link local addresses that can be used in a local network include 10.0.0.~10.255.255.255, 172.16.0.0~172.31.255.255, and 192.168.0.0~192.168.255.255).

ION IPv6 Unicast Address support includes:

- Link-local IPv6 address (FE80::/10 + Intf(64))
- Global address (2000::/3 + prefix(45) + Subnet(16) + Intf(64))
- Unique Local IPv6 Unicast Addresses (FC00::/7 + Global ID(40) + Subnet(16) + Intf(64))

Note: ION supports one Link-local IPv6 address which is read-only and one Global Address or Unique Local address. The Link-local address is configured on ION device using the link-local prefix FE80:: /10 (1111 1110 10) and the interface identifier in the modified EUI-64 format. The Global Address or Unique Local address can be configured via the static method, DHCPv6, and stateless auto-configuration. Other IP v6 addresses can be set in ION system by Web/CLI/FP, but only to test in certain situations.

ION does not allow Loopback [::1/128] in any address field user can input. Unspecified address [::/128] is used for user to clear current address.)

ION IPv6 multicast support includes:

- Solicited-node multicast group (FF02:0:0:0:1:FF00::/104)
- All nodes link-local multicast group (FF02::1)
- All routers link-local multicast group (FF02::2)

Note: These commands can only be entered at the device level - when the last part of the command line prompt indicates the location is a device (L1D, L2D or L3D).

The following commands are for IP, DNS, or DHCP operations.

Set DCHP Client State

C1|S7|L1D>

Syntax:set dhcp state={enable | disable}Description:Enables or disables the DHCP client state. Note: the command "set dhcp state" is
replaced by "set ip address mode" after ION v 1.2.0.
Enabling DHCP allows the IP address of the IONMM to be automatically selected from a
list in the DHCP server. Disabling DHCP requires that the IP address, subnet mask and
default gateway be set manually.Example:C1|S7|L1D>set dhcp state enable
C1|S7|L1D>set dhcp state disable

Note:

- A Configuration backup does not back up the leased IP address; only the DHCP state is backed up.
- A DHCP server must be on the network, configured, and accessible for dynamic IP address assignment via DHCP.
- If the DHCP server can't be reached, the DHCP client will try to reach the DHCP server every 30 seconds until it gets a correct response from the DHCP server. Before getting the IP address, an ION device is not manageable via the Web interface. You must log in through CLI and set the DHCP function to 'disable', set an IP address, and then login via the Web interface again.
- If any port changes from link down to link up, the DHCP client will try to renew the IP settings by resending the DHCP request to DHCP server.

Set DNS Server

Syntax:	set dns–svr svr= <xx> type=<yy> addr=<zz></zz></yy></xx>				
Description: Defines a single DNS s		server. Up to six servers can be defined in the system, <u>where</u> :			
	svr = x = DNS server index number (1-6). DNS servers 1-3 are for IPv4; DNS servers 4-6 are for IPv6. See "DNS '3 vs. 3' Rule ('Up to 3' Rule)' on page Error! Bookmark not defined.				
type = y = ipv4 or ipv6. The IP address type; enter ipv4 or ipv6					
	addr = z = a valid IPv4 or IPv6 address (depending on the type= parameters).				
<i>Example</i> : Agent III Ci	l S1 L1D> set dns	s-svr svr 1 type ipv4 addr 192.168.1.30			
to user menu Agent III C server1 to s Agent III C	Caution: only the first three valid DNS server can be available, please refer to user menu for the details Agent III C1 S1 L1D> set dns-svr svr 1 type ipv6 addr 192.168.1.30 server1 to server3 is just used for ipv4! Agent III C1 S1 L1D> show ip-mgmt config IPv4 management configuration:				
IP subnet mask: Gateway IP address:		192.168.1.10 255.255.255.0 192.168.1.0 Static			
Management State: Link Local Address: Global Address Mode: Global Address: Management Prefix: Duplicate Address Detect: Gateway Mode: Gateway Address:		fe80::2c0:f2ff:fe20:de9e static :: 64			
server index	k addr_type	address			
DNS server1 DNS server2 DNS server3 DNS server4 DNS server5 DNS server6 Agent III C	ipv4 ipv4 ipv4 ipv6 ipv6 ipv6	192.168.1.30 192.168.1.40 192.168.1.50 :: ::			

Messages:

warning: server1 to server3 is just used for ipv4! warning: server4 to server6 is just used for ipv6!

Use the **show ip-mgmt config** command to display the current DNS server information.

Static DNS Server Configuration note: You can enter a DNS Server address manually. For IPv4, if IP address mode is static, you must enter the DNS server addresses manually. For IPv6, if IP address mode is static or stateless, you must enter the DNS server address manually.

Note: When a DNS server has more than one IP address, the first IP address will be used and the other IP addresses will be ignored. So if the first IP address cannot be used, the other IP addresses will not be checked.

DNS '3 vs. 3' Rule ('Up to 3' Rule)

Up to six DNS IPv6 services are supported. The ION DNS '3 vs. 3' rule (or "up to 3" rule) is based on two concepts:

1. If the DNS server is 0.0.0.0 or ::, ION considers it an invalid DNS address; others are considered valid DNS addresses.

2. If the DNS server actually works, ION consider it an available DNS address, and others are considered 'unavailable' addresses even if they are actually 'valid' addresses.

ION supports six DNS servers; however, because of some system constraints (e.g., timeout issues) ION utilizes up to three valid DNS addresses to determine if they are available. So there may be at most three valid DNS addresses which cannot be used, though one of them might be valid and available. ION DNS Servers 1, 2, and 3 are reserved for IPv4 only, and DNS Servers 4, 5, and 6 are just for IPv6.

To balance the IPv4 and IPv6, the sequence of DNS Server validity checking is 1, 4, 2, 5, 3, 6 with supporting logic that determines:

1. If the DNS address is invalid, it will be skipped.

2. ION will check up to three valid DNS addresses in the sequence above to find the first available DNS address. When an available DNS address is found, the validity checking process will stop.

Set IP Type / Address / Subnet Mask

Syntax: set ip type=ipv4 addr=<xx> subnet-mask =<yy>

Description: Defines the IP address and subnet mask of the card. The static IP address assignment is part of the initial NID setup, and at first the CLI must be used to configure the IP address settings. Thereafter, remote management and/or DHCP addressing can be configured. The defaults are IP Address = 192.168.0.10, Subnet Mask = 255.255.255.0, Default Gateway = 192.168.0.1, with no DNS address assigned, and no DHCP client enabled. When manually setting the NID's IP address, it can only be given a Class A, Class B or Class C address; it cannot be given a multicast or reserved IP address. The addresses that can be used in a local network include 10.0.0~10.255.255.255, 172.16.0.0~172.31.255.255, and 192.168.0.0~192.168.255.255).

where:

xx = IP address of the module

yy = subnet mask

Example:

C1|S13|L0D/>set ip type=ipv4 addr=192.168.0.10 subnet-mask=255.255.255.0

Use the **show ip-mgmt config** command to display the current IP address information.

Set IP Address Mode

Syntax: set ip address mode={bootp|dhcp|static}

Description: Changes the IP addressing method to BootP, DHCP, or Static addressing,

where:

bootp = (Bootstrap Protocol) uses UDP port number 67 for the server and UDP port number 68 for the BootP client.

dhcp = (Dynamic Host Configuration Protocol) for assigning dynamic IP addresses to devices on a network; a device can have a different IP address every time it connects to the network (the default setting).

static = a well-defined IP address which this device always uses and which no other computer can use.

Example: C1|S10|L1D>set ip address mode ?
 bootp
 dhcp
 static
C1|S10|L1D>set ip address mode=bootp
C1|S10|L1D>set ip address mode=dhcp
C1|S10|L1D>set ip address mode=static

Note: Use the **show ip-mgmt config** command to display the current IP address mode setting. **Note**: the command "**set dhcp state**" is replaced by "**set ip address mode**" after ION v 1.2.0.

BootP Addressing Configuration

- 1. Configure IPv4 address mode to "bootp".
- 2. Connect ION to the BootP server.
- The BootP options display: Option: (t=55,l=9) Parameter Request List 1=Subnet Mask
 3=Router
 6=Domain Name server
 12=Host Name
 15=Domain Name
 28=Broadcast Address
 40=Network Information Service Domain
 41=Network Information Service Servers
 42=Network Time Protocol Servers
- 4. For more definition, refer to IETF RFC 951, RFC 2132, etc.

Note that ION does not support some of the displayed BootP options, such as Network Information Service Domain (40), Network Information Service Servers (41), Network Time Protocol Servers (42) or others.

The BootP function is restricted from supporting dynamic getting DNS. Unlike DHCP, the BOOTP protocol does not provide a protocol for recovering dynamically-assigned addresses once they are no longer needed. It is still possible to dynamically assign addresses to BOOTP clients, but some administrative process for reclaiming addresses is required.

Set Gateway IP Address

Syntax:	set gateway type=ipv4 addr= <xx></xx>	
Description:	Defines the default gateway IP address on the module, <u>where</u> :	
	type= <xx> = Gateway type (Ipv4 or IPv6) addr=<yy> = a valid IPv4 or IPv6 address</yy></xx>	
Example:	C1 S7 L1D> set gateway type=ipv4 addr=192.168.0.1 C1 S7 L1D>	
Messages:	Error: the subnet mask of gateway is different from the one of global address	

Use the **show ip–mgmt config** command to display the current gateway IP address information.

Show IP Configuration

Syntax: show ip–mgmt config

Description: Displays the IP management configuration parameters on the NID.

Example:

C1|S18|L1D>set ip type=ipv4 addr=192.168.1.10 subnet-mask=255.255.255.0 C1|S18|L1D>set gateway type=ipv4 addr=192.168.1.0 Agent III C1|S1|L1D>show ip-mgmt config IPv4 management configuration: -----IP management state:enableIP address:192.168.1.10IP subnet mask:255.255.255.0 Gateway IP address: 192.168.1.0 IP address mode : Static IPv6 management configuration: Management State:enableLink Local Address:fe80::2Global Address Mode:staticGlobal Address:2001:12 fe80::2c0:f2ff:fe20:e939 Global Address: 2001:1234::1 Management Prefix: 64 Duplicate Address Detect: false Gateway Mode: routerDisc Dynamic Router Table: Table1 Destination: 2001:1234:: Table1 PfxLen: 64 Table1___NextHop: :: Table1 Age: 84315 Table2__Destination: fe80:: Table2___PfxLen: 64 Table2__NextHop: :: Table2 Age: 84315 Table3 Destination: ff00:: Table3 PfxLen: 8 Table3__NextHop: :: Table3__Age: 84315 server index addr_type address DNS server1 ipv4 0.0.0.0 DNS server2 ipv4 0.0.0.0 DNS server3 ipv4 0.0.0.0 DNS server4 ipv6 :: ipv6 DNS server5 :: DNS server6 ipv6 :: Agent III C1|S1|L1D>

Set IPv6 Management State

 Syntax:
 set ipv6-mgmt state={disable|enable}

 Description:
 A device level command to turn on or turn off control within IPv6. The IPv6 Management State must be set to 'enable' in order to control IPv6 configuration (Link Local Address, Global Address Mode, Global Address, Management Prefix, Duplicate Address Detect, Gateway Mode, and Gateway Address).

 Example:
 Agent III C1|S1|L1D>set ipv6-mgmt state ? disable enable Agent III C1|S1|L1D> set ipv6-mgmt state=enable

Set IPv6 Management State

Command: Syntax:	Set IPv6 Mode set ipv6 address mode= <static dhcpv6 stateless></static dhcpv6 stateless>			
Description:	This device level command configures the IPv6 method to be used on the device. The default is static. If 'Stateless Auto configuration' is selected, then Route Discovery must first be enabled. The parameters are:			
	ipv6 = lpv6 pref	ix for the interface.		
	method	= IPv6 method, either:		
	dhc	pv6 = DHCPv6 method is used for IPv6.		
	stat	reless = stateless method is used (not "stateful" IPv6 mode).		
	stat	<i>ic</i> = static IPv6 method is used (the default).		
Example:				
Agent III C1 S1 L1D> set ipv6 address mode ? dhcpv6 stateless				
static Agent III C1 S	S1 L1D> set ipv6	address mode static		
•	•	address mode stateless		
Stateless Auto Configuration is based on the function of Route Discovery.				
Right now, Route Discovery is disabled. Please enable it before switching to Stateless Auto configuration.				
-	Agent III C1 S1 L1D> set ipv6 address mode dhcpv6			
Agent III C1 S1 L1D> show ip-mgmt config				
IPv4 management configuration:				
IP management	ement state: enable			
IP address:		192.168.1.10		
IP subnet mask	<:	255.255.255.0		
Gateway IP add		192.168.1.0

DNS server6 ip		
Agent III C1 S1 L	1D>	

Set IPv6 Gateway Method

Command:	Set IPv6 Gateway Method			
Syntax:	set ipv6 gateway method= <static routerdisc></static routerdisc>			
Description:	Device level command to configure the IPv6 gateway method to be used.			
	where:			
	static = the static method is to be used (the default).			
	routerdisc = the dynamic method (Route Discovery) is to be used.			
Example:	<pre>Agent III C1 S1 L1D>set ipv6 gateway mode ? routerDisc static Agent III C1 S1 L1D>set ipv6 gateway mode routerDisc Agent III C1 S1 L1D>show ip-mgmt config IPv4 management configuration:</pre>			
	IP management state: enable IP address: 192.168.1.10 IP address: 192.168.1.10 Gateway IP address: 192.168.1.0 IP address mode : Static IPv6 management configuration:

	DNS server6 ipv6 :: Agent III C1 S1 L1D>			

LPT Commands

Link Pass Through (LPT) is a troubleshooting feature that allows the media converter to monitor both the fiber and copper RX ports for loss of signal. In the event of a loss of RX signal on one media port, the converter will automatically disable the TX signal of the other media port, thus passing through the link loss.

Note: These commands can only be entered at the device level - when the last part of the command line prompt indicates the location is a device (L1D, L2D or L3D).

The following commands are used for link pass through operations.

Set Link Pass Through Monitoring Port

Syntax: set lpt monitor-port=<xx>

Description: Defines the port on this slide-in module used for LPT monitoring.

Example:	C1 S5 L1D> set lpt monitor-port=1
	C1 S5 L1D>

Use the **show lpt config** command to display the current link pass through configuration.

Set Link Pass Through Status

 Syntax:
 set lpt state={enable | disable | notSupported}

 Description:
 Enables or disables the link pass through function on a slide-in module, or configures it as 'not supported'.

 ExampLe:
 C1|S3|L1D>set lpt state=enable C1|S3|L1D>

Use the **show lpt config** command to display the current link pass through configuration.

Set Selective Link Pass Through Status

Syntax: **set selective lpt state**={enable | disable}

Description: Enables or disables the selective link pass through feature on a slide-in module. This feature monitors the fiber Rx port for signal loss. If the fiber Rx goes down, the copper port stops transmitting. TLPT and SLPT are operational with fiber redundancy enabled or disabled.

Example: C1|S5|L1D>set transparent lpt state enable C1|S5|L1D>set selective lpt state enable C1|S5|L1D>

Use the **show lpt config** command to display the current link pass through configuration.

Set Transparent Link Pass Through Status

Syntax: **Set transparent lpt state**={enable | disable}

Description: Enables or disables the transparent link pass through (TLPT) feature on a slide-in module.

With LOAM enabled, TLPT with automatic link restoration is available for the copper ports on the local and remote peer devices. When a copper port goes down, the information is passed to the other device and the copper port on that device will go down. When the link is restored, the link on the other port is also restored. The fiber ports remain up. When TLPT is disabled, if the copper port link drops it does not affect its peer's copper port links. Auto Link Restoration will restore the broken link automatically upon correcting the fault condition. TLPT and SLPT are operational with fiber redundancy enabled or disabled.

Example:	C1 S5 L1D>set transparent lpt state enable
	C1 S5 L1D>set selective lpt state enable

Use the **show lpt config** command to display the current link pass through configuration.

Show Link Pass Through Configuration

Syntax: show lpt config

Description: Displays the Link Pass Though (LPT) configuration for the slide-in module.

 Example:
 C1|S3|L1D>show lpt config

 Link pass through configuration:

 Link pass through state:

 notSupported

 Transparent link pass through state:

 Selective link pass through state:

 Link pass through monitor port:

 2

 Remote fault detect state:

Set remote fault detect status

 Syntax:
 set rfd state={status}

 Description:
 Sets the remote fault detect (RFD) state on a x3x2x or a x3x3x card.

 where:
 status = {enable|disable|notSupported }

Example: C1|S16|L1D/>set rfd state=enable C1|S16|L1D/>

Use the **show lpt config** command to display the current RFD configuration.

Note: Some product catalog features do not match the actual features (i.e., C2220 / C322x / C323x series: support "TLPT, SLPT features"; do not support "Remote Fault Detect (RFD)".

LOAM (Link OAM) Commands

OAM (Operation, Administration and Maintenance) is a set of functions designed to monitor network operation in order to detect network faults and measure its performance. Ethernet OAM functionality allows network operators to measure quality of service (QoS) attributes such as availability, frame delay, frame delay variation (jitter and frame loss). Such measurements help identify problems before they escalate so that users are not impacted by network defects.

Ethernet Connectivity Fault Management (CFM) is provided per IEEE 802.3ah OAM. The major features covered by this protocol are Discovery, Link Monitoring, Remote Fault Detection, and Remote Loopback. The x222x/x32xx NIDs support Link layer OAM (LOAM, per IEEE 802.3–2005 Clause 57).

802.3 LOAM Event	Default Value	Low Limit	High Limit
ErrSymPeriodWindowHi	0	0	0x0FFFFFF
ErrSymPeriodWindowLo	0x07735940	1	0x0FFFFFF
ErrSymPeriodThreshold Hi	0	0	0x0FFFFFF
ErrSymPeriodThresholdLo	1	0	0x0FFFFFF
ErrFramePeriodWindow	0x1AAAAA	1	0x63FFFFD8
ErrFramePeriodThreshold	1	0	0x0FFFFFF
ErrFrameWindow	10	10	600
ErrFrameThreshold	1	0	0x0FFFFFF
ErrFrameSecsSummaryWindow	100	100	9000
ErrFrameSecsSummaryThreshold	1	0	9000

The LOAM Event Config (dot3oam) commands have the following default values and valid ranges.

Note: The LOAM commands can only be entered at the port level - when the last part of the command line prompt indicates the location is a port (LxPy; where y is 1, 2 or 3).

The following commands are used for LOAM operations.

Clear LOAM Statistics

Syntax: clear loam stats

Description: Clears the LOAM statistics on a port and restarts the counters.

Note: Use the show loam statistics command to display LOAM counters information.

Get LOAM Peer Information

Syntax:	show loam peer information		
Description:	Displays the LOAM peer's configuration information.		
Example:	C1 S16 L1D>show loam peer info Error: this command should be e C1 S16 L1D>go l1p=1 C1 S16 L1P1>show loam peer info Link OAM peer configuration: Link OAM peer MAC address: @ Link OAM peer vendor OUI: @ Link OAM peer vendor oUI: @ Link OAM peer wendor info: @ Link OAM peer mode: Link OAM peer maximum PDU size: Link OAM peer configure revisio Link OAM peer function supporte C1 S16 L1P1>	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	

Note: This command Displays the LOAM peer's Organizationally Unique Identifier (OUI) vendor information. The Vendor OUI displays in the format 00.00.00. All IEEE 802.3 defined events (as appearing in [802.3ah] except for the Organizationally Unique Event TLVs) use the IEEE 802.3 OUI of 0x0180C2. Organizations defining their own Event Notification TLVs include their OUI in the Event Notification TLV that gets reflected here.

Ignore Loopback Requests

Syntax:	set loam ignore-loopback-request {enable disable}
	where:
	enable – causes the LOAM enabled x222x/32xx NID to ignore all Loopback requests (i.e., not respond to remote loopback requests from peers). disable – causes the LOAM enabled x222x/32xx NID to respond to all remote loopback requests (LBRs) from peers.
Description:	Forces the NID to ignore or respond to all remote loopback requests from peers. The default is disabled (responds to all remote loopback requests from peers).
Example:	C1 S16 L1P2>set loam ignore-loopback-request ? disable enable C1 S16 L1P2>set loam ignore-loopback-request disable C1 S16 L1P2>set loam ignore-loopback-request enable C1 S16 L1P2>

Note: Use the **show loam ignore-loopback-request** command to display the NID port's current LBR response mode.

Set LOAM Admin State

Syntax: **set loam admin state**={enable | disable}

Description: Defines whether LOAM is enabled or disabled on this device port.

Example: C1|S16|L1P2>set loam admin state ?
 disable
 enable
C1|S16|L1P2>set loam admin state disable
C1|S16|L1P2>set loam admin state enable
C1|S16|L1P2>

Set LOAM Critical Event Notification State

Syntax: **set loam critical–evt–notif** ={enable | disable}

Description: Enables or disables whether LOAM notification is done for critical events for a device.

Set LOAM Dying Gasp Event Notification State

Syntax: set loam dg-evt-notif={enable | disable}

Description: Enables or disables whether LOAM notification is done for dying gasp events on a device. These are unrecoverable conditions such as loss of power.

Set LOAM Errored Frame Event Notification State

Syntax: **set loam ef–evt–notif**={enable | disable}

Description: Enables or disables whether LOAM notification is done when the number of frame errors exceed the threshold value defined for this event on a device (see Set LOAM Errored Frame Threshold Value).

Set LOAM Errored Frame Threshold Value

Syntax: set loam ef threshold=<xx>

Description: Defines the number of frame errors that must occur within the defined window before notification of this event is made on a device (see Set LOAM Errored Frame Window Value). The valid Error frame threshold range is 0 – 268435455 frame errors.

Use the **show loam event config** command to display the current setting.

Set LOAM Errored Frame Window Value

Syntax: set loam ef window=<xx>

Description: Defines the amount of time (in 100ms increments) in which the threshold value must occur before an event notification is sent for a device. The valid Error frame window range is 10 - 600 milliseconds (1 second - 1 minute).

Use the **show loam event config** command to display the current setting.

Set LOAM Errored Frame Period Event Notification State

- *Syntax:* **set loam efp–evt–notif**={enable | disable}
- *Description:* Enables or disables whether LOAM notification is done for errored frame period events for a device (see Set LOAM Errored Frame Period Threshold Value).

Use the **show loam event config** command to display the current setting.

Set LOAM Errored Frame Period Threshold Value

Syntax: set loam efp threshold=<xx>

Description: Defines the number of frame period errors that must occur within the defined window before notification of this event is made for a device (see Set LOAM Errored Frame Period Window Value). The valid Error frame period threshold range is 0 – 268435455 frame period errors.

Use the **show loam event config** command to display the current setting.

Set LOAM Errored Frame Period Window Value

Syntax: set loam efp window=<xx>

Description: Defines the number of frames in which the threshold value must occur before an event notification is sent for a device. The valid Error frame period window range is 174762 – 104857560 frames.

Use the **show loam event config** command to display the current setting.

Set LOAM Errored Frame Seconds Summary Event Notification State

Syntax: **set loam efss–evt–notif**={enable | disable}

Description: Enables or disables whether OAM notification is done for errored frame seconds summary events (see Set LOAM Errored Frame Seconds Summary Threshold Value).

Use the show loam event config command to display the current setting.

Set LOAM Errored Frame Seconds Summary Threshold Value

Syntax: set loam efss threshold=<xx>

Description: Defines the number of errored frames that must occur within in the defined window before notification of this event is made (see Set LOAM Errored Frame Seconds Summary Window Value). The valid EFSS threshold range is 0 – 268435455 errored frames.

Use the show loam event config command to display the current setting.

Set LOAM Errored Frame Seconds Summary Window Value

Syntax: set loam efss window=<xx>

Defines the amount of time (in 100ms increments) in which the threshold value must occur before an event notification is sent. The valid EFSS window range is 100 - 9000 ms (1 second – 90 seconds). Use the **show loam event config** command to display the current setting.

Set LOAM Errored Symbol Period Event Notification State

Syntax: **set loam esp–evt–notif**={enable | disable}

Enables or disables whether OAM notification is done for errored symbol period events (see Set LOAM Errored Symbol Period Threshold Value). Use the **show loam event config** command to display the current setting.

Set LOAM Errored Symbol Period Threshold Value

Syntax: set loam esp threshold high=<xx> low=<yy>

Description: Defines the number of error symbols that must occur within in the defined window before notification of this event is made (see Set LOAM Errored Frame Seconds Summary Window Value).

where:

- the high errored symbol threshold as a number of error symbols. If the number of error symbols in the window period is equal to or greater than xx, then a user defined action will be triggered. The valid range is 0 4294967295.
- yy = the low errored symbol threshold as a number of symbol errors. If the number of error symbols in the window period is equal to or greater than yy, then the Errored Symbol Period Link Event will be generated. The valid range is 0 4294967295.

Use the **show loam event config** command to display the current setting.

Set LOAM Errored Symbol Period Window Value

- Syntax: set loam esp window high=<xx> low=<yy>
- *Description:* Defines the threshold window in which the threshold value must occur before an event notification is sent. Use the **show loam event config** command to display the current setting.

where:

- the high errored symbol window threshold as a number of error symbols. If the number of error symbols in the window period is equal to or greater than xx, then a user defined action will be triggered. The valid Error symbol period window high range is 0 4294967295.
- yy = the low errored symbol window threshold as a number of symbol errors. If the number of error symbols in the window period is equal to or greater than yy, then the Errored Symbol Period Link Event will be generated. The valid Error symbol period window low range is 125000000 2684354.

Set LOAM Mode

Syntax: set loam mode={active | passive}

Description: Defines whether discovery process is initiated by the interface or by the peer for a port.

active –the NID sends out discovery frames (OAM Information PDUs). It can initiate OAM Loopback to its remote peer.

passive – the NID can receive and respond to discovery messages (OAM Information PDUs). It cannot initiate LOAM Loopback but can process loopback requests from a LOAM Peer in active mode.

Use the show loam event config command to display the current setting.

Note: To perform Link Fault management, either the local client or the remote peer (or both) must be configured for Active mode operation (**set loam mode=active**).

Show LOAM Configuration

Syntax:	show loam config
Description:	Displays the LOAM configuration of a port.
Example:	C1 S16 L1P1> show loam config Link OAM configuration:
	<pre>Link OAM admin state: disable Link OAM operation status: disabled Link OAM mode: passive Link OAM maximum PDU size: 0 Link OAM configuration revision:0 Link OAM function supported: loopbackSupport+eventSupport C1 S16 L1P1>go l1p=2 C1 S16 L1P2>show loam config Link OAM configuration:</pre>
	Link OAM admin state: enable Link OAM operation status: linkFault Link OAM mode: active Link OAM maximum PDU size: 1500 Link OAM configuration revision:0 Link OAM function supported: loopbackSupport+eventSupport C1 S16 L1P2>
Show LOAM Event Configuration

Syntax:	show loam event config	
Description:	Displays the LOAM event configuration of a port	
Example:	C1 S5 L1P1> show loam event config Link OAM event configuration:	
	Error symbol period event notify: Error frame period event notify: Error frame event notify: Error frame seconds event notify: Dying gasp event notify: Critical event notify: Error symbol period window high: Error symbol period window low: Error symbol period threshold high: Error symbol period threshold low: Error frame period window: Error frame period threshold: Error frame window: Error frame threshold: Error frame threshold: Error frame seconds summary window:	enable enable enable enable enable 0 125000000 0 1 1747626 1 10 1 100 1

Show LOAM Event Log

Syntax: show loam event log

Description: Displays the LOAM event logs of a port.

Example:

C1 S13 L0	0AP1 L1P1/	<pre>>show loam</pre>	event lo	g						
timestamp	OUI	type	location	W-hi	W-lo	T-hi	T-lo	value	R-total	E-total
00:00:01	01:80:c2	linkFault	local	-	-	-	-	-	1	1
00:00:01	01:80:c2	critical	local	-	-	-	-	-	1	1

Show LOAM Peer Configuration

Syntax: show loam peer info *Description:* Displays the LOAM peer configuration of a port. *Example*: C1|S5|L1P2>show loam peer info Link OAM peer configuration: -----_ _ _ _ _ _ _ _ _ _ Link OAM peer MAC address: 00-00-00-00-00-00 Link OAM peer vendor OUI: 00.00.00 Link OAM peer vendor info: 0 Link OAM peer mode: unknown Link OAM peer maximum PDU size: 0 Link OAM peer configure revision:0 Link OAM peer function supported:unidirectionalSupport C1|S5|L1P2>

Show LOAM Statistics

Syntax: show loam statistics

Description: Displays the LOAM statistics of a port.

Example:	C1 S16 L1P1> show loam statistics	
	Link OAM counters:	
	No. of information link OAM PDUs transmitted:	1223
	No. of information link OAM PDUs received:	1232
	No. of unique Event link OAM PDUs transmitted:	222
	No. of unique Event link OAM PDUs received:	2333
	No. of duplicate Event link OAM PDUs transmitted:	2121
	No. of duplicate Event link OAM PDUs received:	2322
	No. of Loopback control link OAM PDUs transmitted:	2114
	No. of Loopback control link OAM PDUs received:	494
	No. of Variable requests link OAM PDUs transmitted:	2323
	No. of Variable requests link OAM PDUs received:	232
	No. of Variable response link OAM PDUs transmitted:	644
	No. of Variable response link OAM PDUs received:	233
	No. of Org. specific link OAM PDUs transmitted:	32545
	No. of Org. specific link OAM PDUs received:	117
	No. of Unsupported Codes link OAM PDUs transmitted	34
	No. of Unsupported Codes link OAM PDUs received:	3445
	No. of frames dropped due to link OAM: C1 S16 L1P1>	123

Show LOAM Ignore Loopback Requests State

Syntax: show loam ignore-loopback-request

Description: Displays the NID port's current LBR response mode (ignore or respond to all remote loopback requests from peers).

 Example:
 C1|S16|L1P1>show loam ignore-loopback-request

 Link OAM Ignore loopback request:
 disable

 C1|S16|L1P1>

MAC Learning Portlist Commands

MAC Learning Port List Enable / Disable

Syntax: set mac enable portlist=x <cr>

Description: Enables or disables the ability to 'learn' MAC addresses on one or more ports, typically for security purposes. With MAC address learning is disabled, only certain traffic (broad-cast traffic, EDP traffic, and packets destined to a permanent MAC address matching that port number) are forwarded to the port. The default setting is enabled.

Used with the current MAC Filtering feature (FDB tab, MACs table)?? or used with the current MAC Addresses Blocking ?

The MAC address can be added to the static MAC address database with the 'connected port' as zero. This will cause any frames from that MAC address database to cause an ATU-member violation on that port, resulting in sending a trap.

where x = 1, 2 or 3 (port 1, port 2, and/or port 3)

disable learning ports <portlist> Disables MAC address learning on one or more ports for security purposes. If MAC address learning is disabled, only certain traffic (broadcast traffic, EDP traffic, and packets destined to a permanent MAC address matching that port number) are forwarded to the port.

enable learning ports <portlist> Enables MAC address learning on one or more ports. The default setting is enabled. Sets the port state to Learning (the other port states -Flooding, Filtering and Forwarding – are disabled).

Example:	C1 S3 L1D> show port mac_learni Port Mac learning:	ng state		
	Port1:	disable		
	Port2:	disable		
	C1 S3 L1D>set mac enable port1	ist 1,2		
	C1 S3 L1D> show port mac_learning state			
	Port Mac learning:			
	Port1:	enable		
	Port2:	enable		
	C1 S3 L1D> set mac enable port1 STR_MAC_LEARNING_PORT_LIST	ist ?		
	C1 S3 L1D>set mac enable port1	ist 0		
	C1 S3 L1D>show port mac_learni	ng state		
	Port Mac learning:			
	Port1:	disable		
	Port2:	disable		

Show Port MAC Learning State

Description:	Displays the current port MAC learning status (port 1, port 2, and/or port 3 enabled or
	disabled).

Syntax: show mac learning port list <cr>

Example 1:	<pre>C0 S0 L1D/>show port mac_learning</pre>	state
	Port Mac learning:	
	Port1:	enable
	Port2:	disable
	Port3:	enable

Example 2:	C1 S18 L1D> show port mac_learning	state
	Port Mac learning:	
	Port1:	disable
	Port2:	enable
	C1 S18 L1D>	

Performance/RMON Statistics

Remote Network Monitoring (RMON) provides standard information that a network administrator can use to monitor, analyze, and troubleshoot a group of distributed LANs and interconnecting T-1/E-1 and T-3/E-3 lines from a central site. RMON specifically defines the information that any network monitoring system will be able to provide. It's specified as part of the MIB as an extension of the SNMP.

Note: this command can only be entered for the port, not the device.

Show RMON Statistics

Syntax: show rmon statistics

Description: Displays the Remote Network Monitoring (RMON) statistics for a port.

Example:

RMON statistics:

Rx	octets:	рр
Rx	packets:	99
Rx	broadcast packets:	rr
Rx	multicast packets:	55
Rx	CRC align errors:	tt
Rx	undersize packets:	uu
Rx	oversize packets:	νν
Rx	fragments:	WW
Rx	jabbers:	XX
Rx	collisions:	уу
Rx	64 octets packets:	ZZ
Rx	65-127 octets packets:	ZZ
Rx	128-255 octets packets:	ZZ
Rx	256-511 octets packets:	ZZ
Rx	512-1023 octets packets:	ZZ
Rx	1024-1518 octets packets:	ZZ

where:

- pp = Number of octets received on the interface since the device was last refreshed. This number includes bad packets and FCS octets, but excludes framing bits.
- qq = Number of packets received on the interface, including bad packets, multicast and broadcast packets, since the device was last refreshed.
- rr = Number of good broadcast packets received on the interface since the device was last refreshed. This number does not include multicast packets.
- ss = Number of good Multicast packets received on the interface since the device was last refreshed.
- tt = Number of CRC and Align errors that have occurred on the interface since the device was last refreshed.

- uu = Number of undersized packets (less than 64 octets) received on the interface since the device was last refreshed.
- vv = Number of oversized packets (over 1518 octets) received on the interface since the device was last refreshed.
- ww = Number of fragments (packets with less than 64 octets, excluding framing bits, but including FCS octets) received on the interface since the device was last refreshed.
- xx = Number of packets received that were more than 1,518 octets long and had a FCS during the sampling session.
- yy = Number of collisions received on the interface since the device was last refreshed.
- zz = Number of xx-byte frames received on the interface since the device was last refreshed.

Example:	C1 S7 L1P1> show rmon statistics RMON statistics:	
	Rx octets:	44190203
	Rx packets:	98764
	Rx broadcast packets:	11929
	Rx multicast packets:	4
	Rx CRC align errors:	0
	Rx undersize packets:	0
	Rx oversize packets:	0
	Rx fragments:	7
	Rx jabbers:	0
	Rx collisions:	0
	Rx 64 octets packets:	13745
	Rx 65-127 octets packets:	11208
	Rx 128-255 octets packets:	2169
	Rx 256-511 octets packets:	1628
	Rx 512-1023 octets packets:	68673
	Rx 1024-1518 octets packets:	1340
	C1 S7 L1P1>	

QoS Commands

In QoS (Quality of Service) the bandwidth, error rates and latency can be monitored, sampled and possibly improved. QoS also delivers the set of tools to help deliver data efficiently by reducing the impact of delay during peak times when networks are approaching full capacity. QoS does not add capacity; nor does it multiplex the signals like WDM. It simply tries to manage data traffic better so that top priority traffic will not be compromised. QoS helps manage the use of bandwidth by applying a set of tools like priority scheme, so certain packets (mission critical must go packets) will be forwarded first.

These commands let you set QOS Priority either 1) by-dst-mac, 2) by-src-mac, 3) by-vlan-id, 4) ieee-tag, 5) ip-tag, or 6) tag-type.

Note: These commands can only be entered at the port level - when the last part of the command line prompt indicates the location is a port (e.g., C1|S3|L1P2>).

The following commands are used for QoS operations.

Set QoS Default Priority for a Port

Syntax: set qos default-priority=<xx>

Description: Defines the default priority (0–7) of a port (where 0 is the lowest priority).

Example: C1|S3|L1P2>set qos default-priority 4
C1|S3|L1P2>

Set Frame Priority: Destination MAC Address is Used

Syntax: **set qos priority by–dst–mac**={enable | disable}

Description: Defines whether the destination MAC address is used to decide frame priority.

Example: C1|S3|L1P2>set qos priority by-dst-mac=enable C1|S3|L1P2>

Set Frame Priority: IEEE Tag is Used

Syntax:	set qos priority ieee-tag={enable disable}
Description:	Defines whether the IEEE tag is used to decide frame priority of a port.
Example:	C1 S3 L1P2> set qos priority ieee-tag=enable
	C1 S3 L1P2>

Set Frame Priority: IP Tag is Used

Syntax:	<pre>set qos priority ip-tag={enable disable}</pre>
Description:	Defines whether the IP tag is used to decide the frame priority of a port.
Example:	C1 S3 L1P2> set qos priority ip-tag=enable
	C1 S3 L1P2>

Set Frame Priority: Source MAC Address is Used

Syntax: **set qos priority by–src–mac**={enable | disable}

Description: Defines whether the source MAC address is used to decide frame priority of a port.

Example:	C1 S3 L1P2> set qos priority by-src-mac=enable
	C1 S3 L1P2>

Set Frame Priority: VLAN ID is Used

Syntax: **set qos priority by–vlan–id**={enable | disable}

Description: Defines whether the VLAN ID (VID) is used to decide frame priority of a port.

Example: C1|S3|L1P2>set qos priority by-vlan-id=enable C1|S3|L1P2>

Set IEEE Priority Remapping

Syntax:	set dot1dbridge ieee-tag-priority= <x> remap-priority=<y></y></x>			
Description:	Defines the priority remapping for IEEE. where:			
	x = index number, 0 – 7 y = priority to remap to, 0 – 3			
Example:	C1 S3 L1P2>set dot1dbridge ieee-tag-priority=3 remap-priority=2 Error: this command should be executed on a device! C1 S3 L1P2>go l1d C1 S3 L1D>set dot1dbridge ieee-tag-priority=3 remap-priority=2 C1 S3 L1D>			

Set Ingress Priority Remapping

Syntax:	set qos ingress-priority= <x>remap-priority=<y></y></x>			
Description:	Defines a port's priority remapping for traffic that originates outside of the network.			
	where:			
	x = index number, 0 – 7			
	y = priority to remap to, $0 - 7$			
Example:	C1 S3 L1P2> set qos ingress-priority=4 remap-priority=4 C1 S3 L1P2>			
Example:	<pre>y = priority to remap to, 0 - 7 C1 S3 L1P2>set gos ingress-priority=4 remap-priority=4</pre>			

Set IP Traffic Class Priority Remapping

set dot1dbridge ip-priority-index= <xx> remap-priority=<y></y></xx>				
Defines a device's priority remapping for IP traffic.				
where:				
xx = index number, 0 – 63				
y = priority to remap to, 0 - 3				
C1 S3 L1D> set dot1dbridge ip-priority-index 3 remap-priority 3 C1 S3 L1D>				

Set Priority Type

Syntax: **set qos priority tag–type**={uselEEE | uselP}

Description: Defines which tag type (IEEE or IP) will be used to decide frame priority type for a port if both tags are available. Both IEEE and IP cannot be configured at the same time.

Example: C1|S3|L1P1>set qos priority tag-type useIEEE C1|S3|L1P1>set qos priority tag-type useIP C1|S3|L1P1>

Use the **show qos config** command to display the current Tag type for priority if both tag types are available.

Set Port Egress Queuing Method

Syntax:	set port egress queuingmethod= <wrr sp></wrr sp>		
Description:	A port-level command used to set the Egress Queue Mode to either "Weighted Round Robin" or "Strict" priority queuing method,		
	where: wrr = Weighted Round Robin egress port queuing sp = Strict egress port queuing		
Example:	<pre>C1 S3 L1P1>set port egress queuingmethod sp wrr C1 S3 L1P1>set port egress queuingmethod= C1 S3 L1P1>set port egress queuingmethod= C1 S3 L1P1>show qos config Default priority: Use IEEE tag for priority: Use IP tag for priority: Tag type for priority if both tag availab Use source MAC address for priority: Use destination MAC address for priority: Use VLAN id for priority: Port Egress Queuing mehod: C1 S3 L1P1></pre>	sp wrr 7 enable enable	

WRR (Weighted Round Robin) is a scheduling discipline wherein each packet flow or connection has its own packet queue. It is a simple approximation of GPS (generalized processor sharing). While GPS serves a near infinite amounts of data from each nonempty queue, WRR serves a number of packets for each nonempty queue (number = normalized (weight / meanpacketsize).

(SP) Strict priority queuing is a response to the disadvantages of FIFO in a congested environment. With the Strict Priority Queuing function enabled, only high priority packages will be passed and all low priority packages will be dropped during a network jam condition (the queuing is based 'strictly' on the assigned priority).

Show Priority Remapping

Syntax:	show qos priority remapping				
Description:	Displays the IEEE priority remapping on a port.				
Example:	C1 S13 l1p2/> show qos priority remapping				
	ingress-priority	remapping-priority			
	0	0			
	1	1			
	2	2			
	3	3			
	4	4			
	5	5			
	6	6			
	7	7			

Show QoS Configuration of a Port

Syntax: show qos config

Description: Displays the QoS configuration of the port indicated in the command prompt.

Example:	C1 S3 L1P1> show qos config	
	Default priority:	7
	Use IEEE tag for priority:	enable
	Use IP tag for priority:	enable
	Tag type for priority if both tag available:	useIP
	Use source MAC address for priority:	disable
	Use destination MAC address for priority:	disable
	Use VLAN id for priority:	disable
	Port Egress Queuing mehod:	wrr
	C1 S3 L1P1>	

RADIUS Commands

These commands can only be entered at the device level - when the last part of the command line prompt indicates the location is a device (L1D, L2D or L3D).

RADIUS is a distributed client/server system that secures networks against unauthorized access. RADIUS clients run on ION and send authentication requests to a central RADIUS server that contains all user authentication and network service access information. RADIUS is a fully open protocol, distributed in source code format that can be modified to work with any security system currently available on the market. RADIUS can be configured with or without TACACS+ configuration.

The RADIUS server can be an IPv4 address, an IPv6 address, or a DNS name. The RADIUS server has strict priorities. If IPv6 is enabled, the device will try to authenticate to the RADIUS servers one by one, based on their priorities, until it gets a response, whether it is an IPv4 address, an IPv6 address or a DNS name. But if IPv6 is disabled, the IPv6 address RADIUS servers will be ignored. Up to six RADIUS servers are supported on one device.

Note: After configuring the NID for RADIUS, your HyperTerminal session ends, and you will be required to enter the RADIUS defined username and password when connecting to the NID.

The following commands are used for RADIUS operations.

Set RADIUS Authentication

Syntax:	set radius client state=<{enable dis	sable}		
Description:	 Enables or disables the RADIUS authentication feature. To determine the current use the show radius config command. Note: After configuring the NID for RADIUS, you must enter the RADIUS defined username and password when connecting to the IONMM. 			
Example:	C1 S3 L1D> set radius client st login: ION Password: Xxxxxxx C1 S3 L1D> show radius config	ate disable		
	RADIUS client state:	disable		

Set RADIUS Retry

Syntax:	set radius svr= <xx> retry=<yy></yy></xx>			
Description:	Defines the number of times the access request will be re-sent to the specified server before being discarded or re-directed to another server, where:			
	xx = server number (1–6)			
	yy = number (0–5) of retry attempts allowed. The factory default is 3.			
Example:	Agent III C1 S1 L1D>set radius svr=1 retry=3 Agent III C1 S1 L1D>			

Set RADIUS Server, Type, and Address

Comm	and:	Set RADIUS Server, Type, and Address			
Syntax	с.	set radius svr=<1-6> type=(ipv4 dns ipv6) addr=ADDR [retry=<1-5>] [timeout=<1-60>]			
Descrij		Define one or more RADIUS servers in terms of Index number, Address type, Address, Retries and Timeouts, <u>where</u> :			
	:	svr = server number (1–6)			
		type= server IP address format; valid choices are:			
		• ipv4 (32-bit address format)			
		• ipv6 (extended IP address format)			
		• dns (domain name address format)			
		addr = RADIUS server IP address			
	retry = optional; number (0–5) of times the access request will be re-sent to the server before being discarded or re-directed to another server. Factory default is 3.				
		timeout = optional; number (0–60) of seconds to wait for a re before re-sending the request. Factory default is 30.	sponse	from the server	
Examp					
Agent		S1 L1D> set radius svr 1 type ipv6 addr fe80::2c0:f S1 L1D> show radius config state: disable	2ff:fe2	20:de9e

5	dns	0.0.0.0	3	30	
6 Agent	dns III C1 :	0.0.0.0	3	30	
Agent					

Set RADIUS Server Secret

Syntax:	set radius svr= <xx> secret=<yy></yy></xx>			
Description:	Defines the server secret for a RADIUS server.			
	where:			
	xx = RADIUS server number (1–6)			
	yy = alphanumeric text string used to validate communications between two RADIUS devices. Maximum length of the secret is 128 characters.			
Example:	C1 S3 L1D> set radius svr=1 secret=Zxytf12a C1 S3 L1D>			
Set RADIUS	Timeout			
Syntax:	set radius svr= <xx> timeout=<yy></yy></xx>			
Description:	Defines the number of seconds to wait for a response from the Radius server before re-sending the request.			
	where:			
	xx = server number (1–6)			
	xx = number (0–60) of seconds			

Example: C1|S3|L1D>set radius svr=1 secret=Zxytf12a C1|S3|L1D>

Show RADIUS Configuration

Syntax:	show radius config
Syntext.	Show radius coming

Description: Displays all RADIUS configurations on the device.

Example:

C1 S3 L1D> show	radius	config	

RADIUS client state: enable RADIUS authentication server: index addr-type addr retry timeout index addr-type addr retry timeout 1 ipv4 192.168.1.30 3 30 2 dns 0.0.0.0 3 30 3 dns 0.0.0.0 3 30 4 dns 0.0.0.0 3 30 5 dns 0.0.0.0 3 30 6 dns 0.0.0.0 3 30	-			9

Redundancy Commands (Fiber Port)

The Fiber Port Redundancy feature is designed to allow customer traffic and CPU-centric protocols to survive a fault on an uplink port by placing the traffic on a secondary backup port.

The Fiber Port Redundancy feature adds a form of automatic protection switching using a LOS mechanism that triggers the switch to the surviving line. The ION system uses 1:1 protection, with a modified form of bi-directional switching.

The fault discovery method is LOS at the receiving interface for a set continuous period of time. Traffic rerouting occurs within a minimum period of time after the Primary Port is declared in the fault state. Traffic flow is restored within a minimum set period of time after a fault occurs.

Set Redundancy State

Syntax:	set redundancy state=(enable disable)
Description:	Sets the redundancy (automatic protection switching) mode for the fiber port. This card must have at least two fiber ports to do redundancy (e.g., x3221 NID).
Example:	C1 S3 L1D> set redundancy state ?
	disable
	enable
	C1 S3 L1D>set redundancy state=enable
	Redundancy is not supported on this card!
	C1 S3 L1D>go l1p=1
	C1 S3 L1P1>set redundancy state=enable
	Error: this command should be executed on a device!
	C1 S3 L1P1>go c=1 s=5 l1d
	C1 S5 L1D>set redundancy state=enable
	C1 S5 L1D>

Show Redundancy Information

- *Syntax:* show redundancy info
- Description: Displays port redundancy information of a card. This card must have at least two fiber ports to do redundancy (e.g., S3231 NID). Customer Port is Port 1, Primary Port is Port 2, Secondary Port is Port 3, and the 'Active Port' is the Port that on which the Redundancy function is active.

Example 1:	C1 S13 L1D> show redundancy info	
	Redundancy information:	
	Port redundancy state:	disable
	Primary port:	2
	Secondary port:	3
	Active port:	N/A

Example 2: C1|S3|L1P1>show redundancy info Error: this command should be executed on a device! C1|S3|L1P1>**go 11d** C1|S3|L1D>**show redundancy info** Redundancy is not supported on this card! C1|S3|L1D>go c=1 s=8 l1d C1|S8|L1D>show redundancy info Redundancy information: _____ disable Port redundancy state: Primary port : 2 3 Secondary port : 2 Active port : C1|S8|L1D> C1|S8|L1D>set redundancy state ? disable enable C1|S8|L1D>set redundancy state=enable C1|S8|L1D>**show redundancy info** Redundancy information: -----Port redundancy state: enable 2 Primary port : 3 Secondary port : Active port : 2 C1|S8|L1D>

Serial File Transfer Protocol (X/Y/Zmodem) Commands

Use the **serial (get / put / upgrade) protocol** commands to transfer a file over a serial line (**(xmodem / xmodem-1k / ymodem / zmodem)**. These commands can only be entered at the device level (e.g., when the command line prompt is C1|S8|L1D> or similar). These commands function similar to the TFTP download function; technical support can download configuration files and firmware files through the USB port by entering the corresponding CLI commands.

General Usage: serial (get|put|upgrade) protocol=(xmodem|xmodem-1k|ymodem|zmodem) file=FILE%s

You can use HyperTerminal to send and receive text and data files to a remote computer. The status of the transfer is displayed in the HyperTerminal window during the transfer. The remote computer you are connected to must be using the same transfer protocol as your computer when sending or receiving files (xmodem, xmodem-1k, ymodem, or zmodem). File transfer information is usually provided once you sign into the remote system or is sent via an email from an administrator running the remote system. You can have just one connection open for each HyperTerminal session. However,; you can start multiple HyperTerminal sessions, opening a new connection for each session, as long as each connection uses a different communication (COM) port.

Serial Get Protocol

Syntax:	serial get protocol={xmodem xmodem-1k ymodem zmodem}
Meaning:	Sends a request to servers / local file system to download content for a subsequent <i>put</i> command.
Example:	
xmodem xmodem-1k ymodem zmodem	erial ? erial get protocol ? erial get protocol zmodem file xxxx
Warning: the trieve file	e input file name will be ignored when using ymodem/zmodem to re-
now start to	b transfer the file CBB0BB0BB0BB0BB0BB0BB0BB0BB0B OBB0

Serial Put Protocol

Syntax:	serial put protocol=xxx
Meaning:	Sends a request to servers / local file system to upload content.
Example:	C1 S1 L1D>serial put protocol zmodem file xxxx now start to transfer the file Šlsz: cannot open /tftpboot/xxxx: No such file or directory BB0BB0BB0 BB0BB0 Can't open any requested files. BB0BB0BB0BB0BB0 file transfer failed!

Serial Upgrade Protocol

Command:	Serial Upgrade Protocol
Syntax:	serial upgrade protocol=xxx
Meaning:	Performs a firmware upgrade over the selected serial line.
Example:	<pre>C1 S1 L1D>serial upgrade protocol ? xmodem xmodem-1k ymodem zmodem C1 S1 L1D>serial upgrade protocol zmodem file xxxx now start to transfer the file **B00000063f694ceive.**B00000063f694 CCCCCCCCCBB0BBBB0BBBB0BBB0BB0BB0BB0BB0BB</pre>

If the serial file transfer causes HyperTerminal (HT) to have problems recognizing ION CLI commands, type **q** and press **Enter**, and then log back in to HT.

Message: Zmodem with Crash Recovery file receive for IONMM

Zmodem with Crash Recovery dialog fields:

Receiving: Storing as: Files: Last event: Connection timed out Retries: Status: Connection timed out File: Elapsed: Remaining: Throughput:

Cancel button: Skip File button: cps/bps button: characters per second / bits per second.

ZMODEM timing is receiver driven. The transmitter should not time out at all, except to abort the program if no headers are received for an extended period of time (e.g., one minute). Accurate crash recovery requires that the receiver's copy of the file match the sender's copy up to the point where the transfer was cut off. If you don't call back instantly the file may change, and simply resuming the transfer will corrupt the file. If this is a concern, choose a program that verifies the accuracy of Crash Recovery.

The X-Y-ZMODEM group of protocols allows you to transfer any kind of data on a disk drive. There are a number of technical differences between the protocols in this group, but the only thing you really need to be concerned about is to select them in reverse alphabetical order. If the system you are connecting with will allow you to use ZMODEM, then use it. If ZMODEM isn't available, use one of the YMODEM protocols. If XMODEM is the only protocol available, use XMODEM. If other protocols are available, it is still usually best to use one of the X-Y-Z protocols.

With HTPE, for Zmodem downloads, start the download on the host and HTPE will start to receive. For downloads with other protocols, start the download on the host and then tell HTPE which file transfer protocol to use to receive. For HTPE uploads, you must tell the host to start to receive and which file transfer protocol to use, then tell HTPE what file to send using which protocol. Any of these file protocols will timeout if one side starts and doesn't get an acknowledgment from the other side after a certain period of time.

SNMP Commands

Note: These commands can only be entered at the device level - when the last part of the command line prompt indicates the location is a device (L1D, L2D or L3D).

Command Summaries

SNMP v3 Commands - Alphabetical List

- 1. Add SNMP Community Name / Access Mode
- 2. Add SNMP Group
- 3. Add SNMP Local User
- 4. Add SNMP Remote Engine
- 5. Add SNMP Remote User Name / Address Type
- 6. Add SNMP Remote User Name / Engine
- 7. Add SNMP Traphost
- 8. Add SNMP View Name
- 9. Remove SNMP Community Name
- 10. Remove SNMP Group
- 11. Remove SNMP Local User
- 12. Remove SNMP Remote Engine
- 13. Remove SNMP Remote User Name / Address Type
- 14. Remove SNMP Remote User Name / Engine ID
- 15. Remove SNMP Traphost
- 16. Remove SNMP View
- 17. Set SNMP Local Engine
- 18. Set SNMP Local User Name
- 19. Set SNMP View
- 20. Show SNMP Community
- 21. Show SNMP Group
- 22. Show SNMP Local Engine
- 23. Show SNMP Local User

24. Show SNMP Remote Engine

- 25. Show SNMP Remote User
- 26. Show SNMP Traphost
- 27. Show SNMP View

SNMP v3 Command Parameters

- 1. add snmp community name=STR_COMM_NAME access_mode=(read_only|read_write)
- 2. add snmp group name=STR_SNMP_GRP security-model=(v1|v2c|v3) security-level=(noAuthNoPriv|authNoPriv|authPriv) [readview = STR_READ_VIEW] [writeview = STR_WRITE_VIEW] [notifyview = STR_NOTIF_VIEW]
- 3. add snmp local user name=STR_USR_NAME security-level=(noAuthNoPriv|authNoPriv|authPriv) [auth-protocol=(md5|sha) password=STR_AUTH_PASS] [priv-protocol=(des|aes) password=STR_PRIV_PASS] [group=STR_GRP_NAME]
- 4. add snmp remote engine addrtype=ipv4 addr=STR_SVR_ADDR port=<1-65535> engine_id= STR_ENGINE_NAME
- 5. add snmp remote user name=STR_USR_NAME addrtype=ipv4 addr=STR_SVR_ADDR port=<1-65535> security-level=(no-AuthNoPriv|authNoPriv|authPriv) [auth-protocol=(md5|sh
 - password=STR_AUTH_PASS] [priv-protocol=(des|aes) password=STR_PRIV_PASS]
- 6. add snmp remote user name=STR_USR_NAME engine=STR_ENGINES security-level=(noAuthNoPriv|authNoPriv|authPriv) [auth-proto-col=(md5|sha) password=STR_AUTH_PASS] [priv-protocol=(des|aes) password=STR_PRIV_PASS]
- add snmp traphost version=(v1|v2c|v3) type=ipv4 addr=STR_SVR_ADDR port=<1-65535> (community|security_name)=STR_CS_NAME security_level=(noAuthNoPriv|authNoPriv) [notify=TRAP_TYPE] [timeout=<0-2147483647>] [retry=<0-255>]
- 8. add snmp view name=STR_SNMP_VIEW oid=STR_VIEW_OID type=(include|exclude)
- 9. remove snmp community name=STR_COMM_NAME
- 10. remove snmp group name=STR_SNMP_GRP [security-model=(v1|v2c|v3) security-level=(noAuthNoPriv|authNoPriv|authPriv)]
- 11. remove snmp local user name=STR_USER_NAME
- 12. remove snmp remote engine addrtype=ipv4 addr=STR_SVR_ADDR port=<1-65535>
- 13. remove snmp remote user name=STR_USER_NAME addrtype=ipv4 addr=STR_SVR_ADDR port=<1-65535>
- 14. remove snmp remote user name=STR_USER_NAME engine=STR_ENGINE_ID
- 15. remove snmp traphost type=ipv4 addr=STR_SVR_ADDR port=<1-65535>
- 16. remove snmp view name=STR_SNMP_VIEW [oid=STR_VIEW_OID]
- 17. set snmp local engine=STR_LOCAL_ENGINE
- 18. set snmp local user name=STR_USER_NAME group=STR_GRP_NAME
- 19. set snmp view name=STR_SNMP_VIEW oid=STR_VIEW_OID type=(include|exclude)
- 20. show snmp community
- 21. show snmp group [name=STR_SNMP_GRP]
- 22. show snmp local engine
- 23. show snmp local user
- 24. show snmp remote engine
- 25. show snmp remote user
- 26. show snmp traphost
- 27. show snmp view [name=STR_SNMP_VIEW]

Each of these SNMP commands is described below.

No Space or Tab Characters Allowed

The Community string, Local user name, Group name, View name, Remote user name, Authentication password, and Privacy password can include any combination of characters except the "space" character.

If you enter a "tab" and "space" character in these fields (via CLI or Web interface) the message "*It can be set to any characters combination except the character tab and space*." and "this.pattern is required: /^[\S]*{1,256}\$/." display. You must then re-enter the command or field without the "tab" or "space" characters.

Command:	Add SNMP Community
Syntax:	add snmp community name=STR_COMIM_NAME access_mode=(read_only read_write)
Description:	Device-level command to create (add) a new unique SNMP v3 community name and assign it an access level (read only or read/write). The snmp community name cannot include "space" characters. This command is available to Write users and Admin users.
	where:
	name = the SNMP community name, up to 32 characters (no spaces). access_mode = the SNMP community access mode (either 'read_only' or 'read_write').
Example:	C1 S1 L1D> add snmp community name =remcorp access_mode =read_only C1 S1 L1D>

Command: Add SNMP Group

Syntax:

 $add snmp group name=STR_SNMP_GRP security-model=(any|v1|v2c|v3) security-level=(noAuthNoPriv|authNoPriv|authPriv)[readview=STR_READ_VIEW][writeview=STR_WRITE_VIEW][notifyview=STR_NOTIF_VIEW]$

Description: Device-level command to create (add) a new unique SNMP v3 Group. The securitymodel can be any, v1, v2c, or v3. The **snmp group name** cannot include "space" characters. This command is used to add a new SNMP group. Three mandatory parameters (name, security-model, security-level) must be given. To make the group work, at least one view (readview, writeview, notifyview) must be specified. You can<u>not</u> add a new group whose name, security level and security level are the same as an existing group. This command is available to Write users and Admin users.

where:

name: SNMP group name, its length should be shorter than 32; security-model = the group's access right (v1, v2c, or v3). security-level = the minimum level of security level (noAuthNoPriv, authNoPriv, or authPriv).

readview = the MIB view that authorize the group's read access (optional). writeview = the MIB view that authorize the group's write access (optional). notifyview = the MIB view that authorize the group's notify access (optional).

Example:

C1|S1|L1D>add snmp group name=rem-corp security-model=any security-level=noAuthNoPriv C1|S1|L1D>

Command: Syntax:	Add SNMP Local User
	add snmp local user name=STR_USR_NAME security-level=(noAuthNoPriv authNoPriv authPriv)
	[auth-protocol=(md5 sha)password=STR_AUTH_PASS][priv-protocol=(des aes)password=STR_PRIV_PASS] [group=STR_GRP_NAME]
Description:	Device-level command to Device-level command to create (add) a unique new SNMP v3
	local user. The SNMP user's security model can only be v3. The snmp local user name
	and password string cannot include "space" characters. This command is available to all Write users and Admin users.
	This command is used to add a new SNMP local user. Three mandatory parameters
	(name, group, security-level) must be given. If security-level is authNoPriv, you must
	also specify auth-protocol type and password. If security-level is authPriv, you must
	specify auth-protocol type and password, and priv-protocol type and password. where:
	name = the SNMP user name (less than 32 characters).
	security-level = the minimum level of security (noAuthNoPriv, authNoPriv, or authPriv). auth-protocol = optional, the type of authentication protocol which is used;
	password = the authentication protocol password (optional).
	priv-protocol = the type of privacy protocol to be used (optional).
Example:	password = the privacy protocol password (optional).
	add snmp local user name=Fitz group=remcorp security-level=authPriv
	col=md5 password=abcd1234 priv-protocol=aes password=abcd1234
C1 S1 L1D>	

Command:	Add SNMP Remote Engine
Syntax:	add snmp remote engine addrtype=ipv4 ipv6 addr=STR_SVR_ADDR port=<1-65535> engine_id=
Description:	STR_ENGINE_NAME Device-level command to add and define a new SNMP v3 remote engine in the
	configuration. This command is available to users with Write or Admin user privileges.

where:

addrtype = the IP addressing type to use (IPv4 or IPv6).
addr = an IP address for the remote engine to be added.
port = the port number of the remote trap host that will receives traps <1-65535>.
engine_id = the remote engine ID to be added.

Example:

C1|S1|L1D>add snmp remote engine addrtype=ipv4 addr=192.168.1.70 port=162 engine_id= 800003640300C0F2209EDE This engineID already exists! C1|S1|L1D>add snmp remote engine addrtype=ipv4 addr=192.168.1.70 port=162 engine_id= 800003640300C0F2208DCE C1|S1|L1D>

Example:

Agent III C1|S1|L1D>add snmp remote engine addrtype ipv6 addr fe80::2c0:f2ff:fe20:de9e port 55 engine_id 800003640300C0F2208DCE Agent III C1|S1|L1D>

Messages: This engineID already exists!

Command: Add SNMP Remote User by IP Address / Port #

Syntax: add snmp remote user name=STR_USR_NAME addrtype=ipv4 addr=STR_SVR_ADDR port=<1-65535>securitylevel=(noAuthNoPriv|authNoPriv|authPriv)[auth-protocol=(md5|sha) password=STR_AUTH_PASS][privprotocol=(des|aes) password=STR_PRIV_PASS]

Description: Device-level command to create (add) a new unique SNMP v3 remote user. The SNMP user's security model can only be v3. The snmp remote user name and password string cannot include "space" characters. This command is available to users with Write or Admin user privileges. This command adds a new SNMP remote user by IP address and port number. Four mandatory parameters (user name, IP addr, port #, and security-level) must be given. If the security level is authNoPriv, you must also specify auth-protocol type and password. If the security-level is authPriv, you must specify the auth-protocol type and password, and the priv-protocol type and password.

where:

name = SNMP user name, up to 32 characters long. addrtype = type of remote trap host address (ipv4). addr = remote trap host address (e.g., 192.168.0.111). port = remote trap host port that will receive traps (e.g., port # 162). security-level = the minimum level of security (noAuthNoPriv, authNoPriv, or authPriv). auth-protocol = an optional type of authentication protocol to be used (MD5 or SHA). password = an optional authentication protocol password. priv-protocol = an optional type of privacy protocol to be used (DES or AES). password = an optional privacy protocol password.

Example:

```
C1|S1|L1D>add snmp remote user name=JeffS addrtype=ipv4 addr=192.168.1.80 port=162 security-
level=authPriv auth-protocol=md5 password=abcd1234 priv-protocol=aes password=abcd1234
Remote engine address is not valid!
C1|S1|L1D>add snmp remote user name rmtusr1 addrtype ipv4 addr 192.168.0.111 port 162
security-level authNoPriv auth-protocol md5 password 1222223333
C1|S1|L1D>
```

Command: Add SNMP Remote User by Engine

Syntax:

add snmp remote user name=STR_USR_NAME engine=STR_ENGINES security-level=(noAuthNoPriv|authNoPriv|authPriv) [auth-protocol=(md5|sha) password=STR_AUTH_PASS] [priv-protocol=(des|aes) password=STR_PRIV_PASS]

Description: Device-level command to create (add) a new SNMP v3 remote user. The SNMP user's security model can only be v3. The snmp remote user name and password string cannot include "space" characters. This command is available to users with Write or Admin user privileges.

This command adds a new SNMP remote user by remote engine ID. Three mandatory parameters (name, engine, and security-level) must be given. If security-level is authNoPriv, you must also specify auth-protocol type and password. If security-level is authPriv, you must specify auth-protocol type and password, and priv-protocol type and password.

where:

name = the SNMP user name of up to 32 characters.

engine = SNMP remote engine to which this remote user belongs (9-64 characters). security-level = the minimum level of security (noAuthNoPriv, authNoPriv, authPriv). auth-protocol = optional, the type of authentication protocol to be used. password = optional, the authentication protocol password. priv-protocol = an optional type of privacy protocol to be used, either DES or AES. password = an optional privacy protocol password.

Example:

C1|S1|L1D>add snmp remote user name=JeffS engine=800003640300C0F2208DCE security-level=authPriv authprotocol=md5 password=abcd1234 priv-protocol=aes password=abcd1234 C1|S1|L1D>

Command: Add SNMP Traphost

Syntax:

add snmp traphost version=(v1|v2c|v3) type=ipv4 addr=STR_SVR_ADDR port=<1-65535>(community|secu-

rity_name)=STR_CS_NAME security_level=(noAuthNoPriv|authNoPriv|authPriv)[notify=TRAP_TYPE] [timeout=<0-2147483647>] [retry=<0-255>]

Description:

Device-level command to add and define a new SNMP trap host to the set of trap hosts configured. Up to 6 trap hosts can be created. The SNMP community/security name length must be less than 32 alphanumeric characters. The "notify", timeout", and "retry" parameters are optional. The **community|security_name** string cannot include "space" characters. This command is available to users with Write or Admin user privileges.

This command is used to add a new SNMP traphost. Five mandatory parameters (version, addr, port, community, and security-level) must be specified. When the SNMP version is v3, the notify type can be "inform", and you can set "timeout" and "retry" values.

where:

version = the SNMP version of the new trap server (v1, v2c, or v3).

addr = the IP address of the trap server being added.

port = the port number for the remote trap host that receive traps <1-65535>. community|security_name = community name for v1 and v2c; security name for v3. security-level = the minimum level of security (noAuthNoPriv, authNoPriv, authPriv). notify = the type of notification - either 'trap' or 'inform' (optional). timeout = optional timeout value <0-2147483647 ms> used when notify=inform.

retry = an optional retry value used when notify=inform.

Example:

C1|S1|L1D>add snmp traphost version=v3 type=ipv4 addr=192.168.1.30 port=162 community=xxxxx security_level=authPriv notify=trap timeout=123456789 retry=100

The specified trap host has existed!

```
C1|S1|L1D>add snmp traphost version=v3 type=ipv4 addr=192.168.1.90 port=162 community=xxxxx security_level=authPriv notify=trap timeout=123456789 retry=100
```

C1|S1|L1D>

Command: Syntax: Description:	Add SNMP View addsnmp view name=STR_SNMP_VIEW oid=STR_VIEW_OID type=(include exclude) Device-level command to create (add) a new unique SNMP v3 View. The snmp view name string cannot include "space" characters. Add a new SNMP view by specifying its name, OID and type. You can not add a default view or a view whose name and OID equal to an existing view. This command is available to users with Write or Admin user privileges. where: name = SNMP view name, its length should be shorter than 32 character with no spaces. oid = family subtree OID that this view includes or excludes. type = indicate this view is to include or exclude the OID.
Example:	C1 S1 L1D>add snmp view name=primeView oid=1 type=include C1 S1 L1D>
Command: Syntax: Description:	Remove SNMP Community remove snmp community name=STR_COMM_NAME Device-level command to delete (remove) an existing SNMP community from the V1/V2C Community String table. The snmp community name string cannot include "space" characters. This command is available to users with Write or Admin user privileges. where: name = SNMP community name (less than 32 characters).
Example:	C1 S1 L1D> remove snmp community name =xxxxxx Cannot find the specified community!

Command: Remove SNMP Group

C1|S1|L1D>

Syntax:

remove snmp group name=STR_SNMP_GRP [security-model=(any |v1|v2c|v3) security level=(noAuthNoPriv|authNoPriv|authPriv)]

C1|S1|L1D>remove snmp community name=xxxxxxx

Description:Device-level command to delete (remove) an existing SNMP v3 Group from the system.
Note that when the security model is v1 or v2c, the groups "public" and "private" cannot
be removed; but when the security model is v3 the groups "public" and "private" can be
removed. The snmp group name string cannot include or "space" characters.
This command is used to remove an existing SNMP group by specifying its name,
security model and security level. You can also just give the group name to remove all
groups that share the same group name. This command is available to all Write users
and Admin users.
where:

name = SNMP group name (less than 32 characters). security-model = the group's access right (v1, v2c, or v3). security-level = the minimum level of security (noAuthNoPriv, authNoPriv, or authPriv).

Example: C1|S1|L1D>remove snmp group name=private2 C1|S1|L1D>

Command:	Remove SNMP Local User
Syntax:	remove snmp local user name=STR_USER_NAME
	<i>Description</i> : Device-level command to delete (remove) a unique new SNMP v3 local user. The SNMP user's security model can only be v3. The snmp local user name string cannot include "space" characters. This command is available to all Write users and Admin users.
	where:
	name = SNMP group name (less than 32 characters).
Example:	C1 S1 L1D> remove snmp local user name= Fitz C1 S1 L1D>

Command: Syntax: Description:	<i>intax</i> : remove snmp remote engine addrtype =ipv4 addr =STR_SVR_ADDR port =<1-65535>				
	where: addr = the remote engi addrtype = the type of port = the port number	the remote engine'		(ipv4). ceives traps <1-65535>.	
Example:					
C1 S1 L1D> sr Remote Addre	n <mark>ow snmp remote engi</mark> n		ort	Remote Engine ID	
192.168.1.20 192.168.1.70)	162 162		800003640300c0f2209ede 800003640300c0f2208dce	
If you remov	C1 S1 L1D> remove snmp remote engine addrtype =ipv4 addr =192.168.1.70 port =162 If you remove this remote engine, all remote users related to this engine will also be removed, continue? (y: yes, n: no)				
y C1 S1 L1D>sh	y C1 S1 L1D> show snmp remote engine Remote Address Remote port Remote Engine ID				
Remote Addre					
192.168.1.20 C1 S1 L1D>)	162	800003646	0300c0f2209ede	

Command: Syntax: Description:	Remove SNMP Remote User by IP Address / Port # removesnmpremoteusername=STR_USER_NAME addrtype=ipv4addr=STR_SVR_ADDR port=<1-65535> Device-level command to delete (remove) an existing remote SNMP user by address type. The snmp remote user name string cannot include or "space" characters. This com- mand is available to users with Write or Admin level privileges. This command removes (deletes) an existing SNMP remote user by IP address and port number.
	where:
	name = the SNMP user name, less than 32 characters. engine = the SNMP remote engine to which the remote user belongs (9-64 characters).
Example:	
	nove snmp remote user name=AliceB addrtype=ipv4 addr=192.168.1.30 port=162 is specified for this address!
Command: Syntax: Description:	Remove SNMP Remote User by Engine ID remove snmp remote user name=STR_USER_NAME engine=STR_ENGINE_ID Device-level command to delete (remove) an existing remote SNMP user by its Engine ID. The snmp remote user name string cannot include "space" characters. This command is available to users with Write or Admin level privileges.
	where:
	name = the SNMP user name, less than 32 characters. engine = the SNMP remote engine to which the remote user belongs (9-64 characters).
Example:	move comp person user name-AliceP engine-200002640200c0f2200cde
C1 S1 L1D>re	<pre>move snmp remote user name=AliceB engine=800003640300c0f2209ede</pre>

Command:	Remove SNMP Traphost
Syntax:	remove snmp traphost type=ipv4 addr=STR_SVR_ADDR port=<1-65535>
Description:	Device-level command to remove a specified SNMP trap host. The specified trap host must have already been created and defined. This command is available to users with Write or Admin level privileges.
	where:
	type = ipv4.

addr = the IP address of the existing traphost to be removed. port = the trap host port number to receive traps <1-65535> to be removed (e.g., 162).

Example:

C1|S1|L1D>**remove snmp traphost type**=ipv4 **addr**=192.168.1.30 **port**=162 C1|S1|L1D>

Command: Syntax: Description:	Remove SNMP View remove snmp view name=STR_SNMP_VIEW [oid=STR_VIEW_OID] Device-level command to delete (remove) an existing SNMP v3 View. The snmp view name string cannot include "space" characters. Removes an existing SNMP view by specifying its name and OID. You can just enter the view name to review all views with that name. The default view can not be removed. This command is available to users with Write or Admin level privileges.				
	where:				
Example:	<pre>name = SNMP view name (less than 32 characters). oid = family subtree OID that this view includes or excludes. C1 S1 L1D>remove snmp view name=defaultView oid=1</pre>				
Lampie.	Invalid OID for this view				
Command: Syntax: Description:	Set SNMP Local Engine set snmp local engine=STR_LOCAL_ENGINE Interactive, device-level command to edit (reset) an existing SNMP v3 local Engine. Note that executing this command will delete all exist local users. This command sets the engine name of the local IONMM card. This command is available to all Write users and Admin users. where:				
	engine = the local engine name (less than 64 characters).				
Local engine	ow snmp local user				
JeffS pr: C1 S1 L1D> se Reseting local H y	V3AuthPriv MD5 DES v3 authPriv MD5 DES ivate2Priv MD5 DES v3 noAuthNoPriv et snmp local engine=800003640300c0f2209ede Engine ID will delete all exist local users, continue?(y: yes, n: no) now snmp local engine = ID: 80.00.03.64.03.00.c0.f2.20.9e.de (hex)				

Note: If you enter the **show snmp remote engine** command with no existing remote engines, the message *"No SNMP remote engine created now!"* displays.

Command:	Set SNMP Group Name for Local User
Syntax:	set snmp local user name=STR_USR_NAME group=STR_GRP_NAME
Description:	Device-level command to set (edit / change) the group name for an existing SNMP local user. This command is available to all Write users and Admin users. Where:
	name = the SNMP user name (less than 32 characters). group = SNMP group name to which the new user is assigned (less than 32 characters).
Example:	C1 S13 L1D> set snmp local user name=newusr1 group=public C1 S13 L1D>

Command:	Set SNMP View Filter Type
Syntax:	<pre>set snmp view name=STR_SNIMP_VIEW oid=STR_VIEW_OID type=(include exclude)</pre>
Description:	Device-level command to edit (change) the filter type of an existing SNMP v3 View.
	The snmp view name string cannot include "space" characters. This command is available
	to users with Write and Admin level privileges. Where:
	name = SNMP view name, its length must be shorter than 32 characters.
	oid = family subtree OID that this view include or exclude.
	type = indicate this view is to include or exclude the OID.

Example:

C1 S1 L1D> show snmp view		
name	OID Sub Tree	type
primeView	1	
defaultView	0	include
defaultView	1	include
defaultView	2	include
C1 S1 L1D>set snmp view name=pr	<pre>imeView oid=1 type=exc</pre>	lude
C1 S1 L1D> show snmp view		
name	OID Sub Tree	type
primeView	1	exclude
defaultView	0	include
defaultView	1	include
defaultView	2	include
C1 S1 L1D>		

Command: Show SNMP Community

Syntax: show snmp community

Description: Device-level command to display all current (existing) SNMP communities' information. This command is available to all SNMP users.

Example:	C1 S1 L1D> show snmp commun Community string	nity Access mode
	comm1 public private remcorp C1 S1 L1D>	read_write read_write read_only read_only

Command: Show SNMP Group

Syntax: show snmp group [name=STR_SNMP_GRP]

Description: Device-level command that displays a current (existing) SNMP v3 Group by name, or all Groups currently defined. After you display a specific Group name, you must log in to the system again. If no group name is specified, displays all available group information on the IONMM card or stand-alone card. If a group name is entered, displays just that group's configuration. This command is available to all users at all privilege levels.

where:

name = the name of a SNMP group (optional)

Example:

C1 S1 L1	D> <mark>show snmp g</mark>	roup			
Name	Security Model	Security Level	Read View	Write View	Notify View
public	v1	noAuthNoPriv	defaultVie	2W	
public	v2c	noAuthNoPriv	defaultVie	2W	
private	v1	noAuthNoPriv	defaultVie	w defaultView	
private	v2c	noAuthNoPriv	defaultVie	w defaultView	
rem-corp	any	noAuthNoPriv	XXXXXX	ZZZZZZZ	
C1 S1 L1	> <mark>show snmp g</mark>	roup public			
Name	Security Model	Security Level	Read View	Write View	Notify View
login: IC	ON				
Password	*****				
Hello, th	nis is TON co	mmand line (ver	sion 1.00).		

Hello, this is ION command line (version 1.00). Copyright 2009 Transition Networks.

C1|S1|L1D>

Command:	Show SNMP Local Engine
Syntax:	show snmp local engine
Description:	Device-level command to display the local SNMP engines configured for the ION system. This command displays the engine ID of the local IONMM card. This command is available to users at all privilege levels.
Example:	C1 S1 L1D> show snmp local engine Local engine ID: 80.00.03.64.03.00.c0.f2.20.9e.de (hex) C1 S1 L1D>

Command: Show SNMP Local User

Syntax: show snmp local user

Description: Device-level command to display information about all local SNMP users configured for the system. This command is available to all users at all privilege levels.

Example:	C1 S1 L1	D> show snmp	local user	•		
User Name	Group Name	Security Mo	del Security	y Level	Auth Protocol	Privacy Protocol
BobB	rem-corp v3	ā	uthNoPriv	MD5		
TedT		v3	noAut	thNoPri	v	
CarolC			authPriv	SHA	١	AES
C1 S1 L1D	>					

Command:	Show SNMP Remote Engine				
Syntax:	show snmp remote engine				
Description:	Device-level command that displays a list of all SNMP v3 remote engines currently configured. This command is available to all SNMP v3 users.				
Example:	C1 S1 L1D> show snmp remote engine				
	Remote Address	Remote port	Remote Engine ID		
	192.168.1.20 C1 S1 L1D>	162	800003640300c0f2209ede		
Command:	Show SNMP Remote User				
Syntax:	show snmp remote user				
Description:	Device-level command to display a list of all SNMP remote users currently configured. This command is available to all users at all privilege levels.				
Evample 1 (no	avisting remote users)				

Example 1 (<u>no</u> existing remote users):

C	1 S1 L1C:	>show snmp	remote user			
U	lser Name	Engine ID	Security Model	Security Level	Auth Protocol	Privacy Protocol
-						
C	1 S1 L1D)>				

Example 2 (<u>one</u> existing remote user):

User Name	Engine ID	Security Model Security Level Auth Protocol Privacy Protocol
Rmtusr1	002fedfe334343535	noAuthNoPriv v3

Command:	Show SNMP Traphost
Syntax:	show snmp traphost
Description:	Device-level command to display the specified SNMP v3 traphost server information or display the traphost server information for <u>all</u> defined and configured SNMP v3 trap hosts. This command is available to all SNMP v3 user levels.
Example:	
C1 S1 L1D>show	snmp traphost

C1 S1 L1D>sh	now snmp tra	phos	t				
Trap version	P	Port	Comunity/Secur	ity name Security level	. Trap/infom	n Timeout Ret	ry times
v3	192.168.1.40	162	private	authNoPriv	trap		
v3	192.168.1.50	162	public	authPriv	trap		
v2c	192.168.1.10	162	public	noAuthNoPriv	inform	1500	3
v1	192.168.1.20	162	public	noAuthNoPriv	trap		
C1 S1 L1D>					·		

Note: If you enter the **show snmp traphost** command with no existing remote engines, the message "*No SNMP trap host is created now!*" displays.

Command: Syntax: Description:	Show SNMP View show snmp view [name=STR_SNMP_VIEW] Device-level command that displays one or all current SNMP View(s). If no view name is specified, show all available views' information on IONMM card or stand-alone card. If a view name is entered, only that view is displayed.			
Example:	ow snmp view			
name		OID Sub Tree	type	
primeView defaultView defaultView defaultView C1 S1 L1D> sh	ow snmp view =primeView	1 0 1 2	exclude include include include	
<pre>login: ION Password:****** Hello, this is ION command line (version 1.00). Copyright 2009 Transition Networks.</pre>

SNTP Commands

Note: These commands can only be entered at the device level - when the last part of the command line prompt indicates the location is a device (e.g., C0|S1|L1D>).

SNTP is a simplified, client-only version of NTP used on ION. SNTP can only receive the time from an NTP server; it cannot be used to provide time services to other systems. SNTP typically provides time within 100 milliseconds of the accurate time, but it does not provide the complex filtering and statistical mechanisms of NTP.

The SNTP server can be an IPv4 address, an IPv6 address, or a DNS name. The SNTP server has strict priorities. If IPv6 is enabled, the device will try to sync time from the servers one by one, based on their priorities, until it gets a response, whether it is an IPv4 address, an IPv6 address, or a DNS name. The ION SNTP client will try once for each SNTP server address and wait 10 seconds for response. If the SNTP server is a DNS name and this name can be mapped to multiple IPv4 or IPv6 addresses, the ION SNTP client will try each address for 10 seconds. If no response is received, the ION SNTP client will try another server address. If IPv6 is disabled, the IPv6 address SNTP servers will be ignored. Up to six SNTP servers are supported on one device. The following commands are used for SNTP operations.

Set Current Time

Syntax:	set curr-time=<"xx">
Description:	Defines the current time for a module, where:
	<pre>xx = current time in the format: "yyyymmdd hh:mm:ss". Note: the quote marks are required.</pre>

Set SNTP Daylight Saving Time Status

Syntax:	<pre>set sntp dst-state={enable disable}</pre>
Description:	Enables or disables the SNTP daylight savings time function on a card.
Example:	C0 S1 L1D> set sntp dst-state enable C0 S1 L1D

Set SNTP Daylight Saving Start Time

Syntax:	set sntp dst-start=<"xx">		
Description:	Defines the date and time that SNTP daylight savings is to begin, where:		
	<pre>xx = start time in the format: "yyyymmdd hh:mm". Note: the quote marks are required.</pre>		
Example:	C0 S1 L1D> set sntp dst-start=<"2010-05-30 02:00"		
	C0 S1 L1D>		

The above command sets the daylight savings time to begin at 2 a.m. on May 30, 2010.
Set SNTP Daylight Saving End Time

Syntax:	set sntp dst-end=<"xx">
Description:	Defines the date and time that SNTP daylight savings is to end.
	where:
	<pre>xx = end time in the format: "yyyy-mm-dd hh:mm". Note: the quote marks are required.</pre>
Example:	C1 S3 L1D>set sntp dst-end=<"2009-11-01 02:00"
	C1 S3 L1D>
	The above command sets daylight savings time to end at 2 a.m. on November 1, 2009.

Set SNTP Daylight Saving Offset

Syntax:	set sntp dst-offset= <xx></xx>
Description:	Defines the amount of time, in minutes (1–720), that clocks are to shift because of daylight savings. Note: the usual time shift is one hour (60 minutes).
Example:	C1 S3 L1D> set sntp dst-offset=30 C1 S3 L1D>

Set SNTP Server Address

Syntax: set sntp-svr svr=<1-6> type=(ipv4|ipv6|dns) addr=ADDR

Description: Defines the address of an SNTP server. Up to six servers can be defined in the system.

where:

xx = server number (1–6)

yy = IP address format; valid choices are:

- ipv4 (32-bit address format)
- **dns** (domain name address format)
- zz = IP address of the SNTP server

Example:

```
C1|S3|L1D>set sntp-svr svr=1 type=ipv4 addr=192.168.1.30
C1|S3|L1D>set sntp-svr svr=1 type=ipv6 addr=fe80::2c0:f2ff:fe21:b243
C1|S3|L1D
```

Set SNTP State

Syntax: **set sntp state**=<{enable | disable}

Description: Enables or disables the SNTP function on an x222x/32xx NID or IONMM card.

Example:

Agent III C1|S4|L1D>**show sntp config** SNTP configuration: _____ SNTP state: disable SNTP daylight saving time state: disable Sntp timezone: (GMT-6:00) Central Time US and Canada Current time: 1970 0104 22:41:19 Sntp daylight saving start time: 1969 1231 18:00:00 Sntp daylight saving end time: 1969 1231 18:00:00 sntp daylight saving offset: 0 Sntp server: index addr-type address - - ------- - - - -1 dns 0.0.0.0 2 dns 0.0.0.0 3 dns 0.0.0.0 4 dns 0.0.0.0 5 dns 0.0.0.0 6 dns 0.0.0.0 Agent III C1|S4|L1D>set sntp state enable Agent III C1|S4|L1D>**show sntp config** SNTP configuration: _____ SNTP state: enable SNTP daylight saving time state: disable Sntp timezone: (GMT-6:00) Central Time US and Canada Current time: 1970 0104 22:42:35 Sntp daylight saving start time: 1969 1231 18:00:00 Sntp daylight saving end time: 1969 1231 18:00:00 sntp daylight saving offset: 0 Sntp server: index addr-type address ----1 dns 0.0.0.0 2 dns 0.0.0.0 3 dns 0.0.0.0 4 dns 0.0.0.0

5	dns	0.0.0	
6	dns	0.0.0	
Agent III	C1 S4 L1D>		

Set SNTP Timezone

Syntax: set sntp timezone=<xx>

Description: Defines the timezone of an IONMM. The value for "zone" is a number from 1–63 as shown in the table below.

Example:

Agent III C1 S1 L1D> set sntp timezone=4 Agent III C1 S1 L1D> show sntp config SNTP configuration:	7
SNTP state: SNTP daylight saving time state: Sntp timezone:	enable disable (GMT+8:00) Beijing, Chongqing, Hong Kong, Urumqi

Current time:

Table 6: Timezones

Zone	Description
1	(GMT –12:00) Eniwetok, Kwajalein
2	(GMT –11:00) Midway, Island, Samoa
3	(GMT –10:00) Hawaii
4	(GMT –09:00) Alaska
5	(GMT –08:00) Pacific Time, US and Canada, Tijuana
6	(GMT –07:00) Arizona
7	(GMT –07:00) Mountain Time, US and Canada
8	(GMT –06:00) Central Time, US and Canada
9	(GMT –06:00) Mexico, City, Tegucigalpa
10	(GMT –06:00) Saskatchewan
11	(GMT –05:00) Bogota, Lima, Quito
12	(GMT –05:00) Eastern Time, US and Canada –
13	(GMT –05:00) Indiana, East
14	(GMT –04:00) Atlantic Time, Canada
15	(GMT –04:00) Caracas, La, Paz
16	(GMT –04:00) Santiago
17	(GMT –03:30) Newfoundland

18	(GMT –03:00) Brasilia
19	(GMT –03:00) Buenos, Aires, Georgetown
20	(GMT –02:00) Mid-Atlantic
21	(GMT –01:00) Azores, Cape, Verde, Is
22	(GMT) Casablanca, Monrovia
23	(GMT) Greenwich Mean Time, Dublin, Edinburgh, Lisbon, London
24	(GMT +01:00) Amsterdam, Berlin, Bern, Rome, Stockholm, Vienna
25	(GMT +01:00) Belgrade, Bratislava, Budapest, Ljubljana, Prague
26	(GMT +01:00) Brussels, Copenhagen, Madrid, Paris, Vilnius
27	(GMT +01:00) Sarajevo, Skopje, Sofija, Warsaw, Zagreb
28	(GMT +02:00) Athens, Istanbul, Minsk
29	(GMT +02:00) Bucharest
30	(GMT +02:00) Cairo
31	(GMT +02:00) Harare, Pretoria
32	(GMT +02:00) Helsinki, Riga, Tallinn
33	(GMT +02:00) Jerusalem
34	(GMT +03:00) Baghdad, Kuwait, Riyadh
35	(GMT +03:00) Moscow, St, Petersburg, Volgograd
36	(GMT +03:00) Nairobi
37	(GMT +03:30) Tehran
38	(GMT +04:00) Abu, Dhabi, Muscat
39	(GMT +04:00) Baku, Tbilisi
40	(GMT +04:30) Kabul
41	(GMT +05:00) Ekaterinburg
42	(GMT +05:00) Islamabad, Karachi, Tashkent
43	(GMT +05:30) Bombay, Calcutta, Madras, New, Delhi
44	(GMT +06:00) Astana, Almaty, Dhaka
45	(GMT +06:00) Colombo
46	(GMT +07:00) Bangkok, Hanoi, Jakarta
47	(GMT +08:00) Beijing, Chongqing, Hong, Kong, Urumqi
48	(GMT +08:00) Perth
49	(GMT +08:00) Singapore
50	(GMT +08:00) Taipei

51	(GMT +09:00) Osaka, Sapporo, Tokyo
52	(GMT +09:00) Seoul
53	(GMT +09:00) Yakutsk
54	(GMT +09:30) Adelaide
55	(GMT +09:30) Darwin
56	(GMT +10:00) Brisbane
57	(GMT +10:00) Canberra, Melbourne, Sydney
58	(GMT +10:00) Guam, Port, Moresby
59	(GMT +10:00) Hobart
60	(GMT +10:00) Vladivostok
61	(GMT +11:00) Magadan, Solomon Is, New Caledonia
62	(GMT +12:00) Auckland, Wllington
63	(GMT +12:00) Fiji, Kamchatka, Marshall, Islands

Show SNTP Configuration

Syntax: show sntp config

Description: Displays all SNTP configurations on the NID.

Example:

Agent III C1 S1 L1D> SNTP configuration:	show sntp config	
SNTP state:		enable
SNTP daylight saving	time state.	disable
Sntp timezone: , Urumqi	5 time state.	(GMT+8:00) Beijing, Chongqing, Hong Kong
Current time:		1970 0102 10:17:17
Sntp daylight saving	g start time:	1970 0101 08:00:00
Sntp daylight saving	g end time:	1970 0101 08:00:00
sntp daylight saving	g offset:	0
Sata convont		
Sntp server: index	addr-type	address
1		0.0.0
1	dns dns	0.0.0
2	dns	0.0.0
3 4	dns	0.0.0
-		
•		0.0.0.0
5 6 Agent III C1 S1 L1D>	dns dns	0.0.0.0 0.0.0.0

Show SNTP Timezone

Syntax:	show timezone		
Description:	Displays all of the time zones that can be specified.		
Example:	C1 S3 L1D> show timezone		
	Available timezone:		
	1 : (GMT-12:00) Eniwetok, Kwajalein		
	2 : (GMT-11:00) Midway Island, Samoa		
	3 : (GMT-10:00) Hawaii 4 : (GMT-9:00) Alaska		
	<pre>6 : (GMT-7:00) Arizona 7 : (GMT-7:00) Mountain Time US and Canada</pre>		
	8 : (GMT-6:00) Central Time US and Canada		
	9 : (GMT-6:00) Mexico City, Tegucigalpa		
	10: (GMT-6:00) Saskatchewan		
	11: (GMT-5:00) Bogota, Lima, Quito		
	12: (GMT-5:00) Eastern Time US and Canada		
	13: (GMT-5:00) Indiana East		
	14: (GMT-4:00) Atlantic Time Canada		
	15: (GMT-4:00) Caracas, La Paz		
	16: (GMT-4:00) Santiago		
	17: (GMT-3:00) Newfoundland		
	: :		
	60: (GMT+10:00) Vladivostok		
	61: (GMT+11:00) Magadan, Solomon Islands, New Caledonia		
	62: (GMT+12:00) Auckland, Wllington		
	63: (GMT+12:00) Fiji, Kamchatka, Marshall Islands		
	C1 S3 L1D>		

SSH Commands

The SSH (Secure Shell) protocol allows data to be exchanged using a secure channel between two networked devices. These commands can only be entered when the last part of the command line prompt indicates the location is a device (L1D, L2D or L3D).

The following commands are used for SSH operations.

Generate SSH Host Key

Syntax:	generate ssh host-key={dsa rsa both}
Description:	Defines the type of host key to be generated.
Example:	C1 S3 L1D>generate ssh host-key both
	Processing
	Host-key generated!
	C1 S3 L1D>

Remove SSH Host Key

 Syntax:
 remove ssh host-key={dsa | rsa | both}

 Description:
 Removes the specified host key for the secure shell.

 Example:
 C1|S3|L1D>remove ssh ?

host-key

public-key

 C1|S3|L1D>remove ssh host-key ?

both
 dsa

rsa
 C1|S3|L1D>remove ssh host-key=dsa

C1|S3|L1D>remove ssh host-key=dsa

C1|S3|L1D>remove ssh host-key=dsa

Remove SSH Public Key From a User

Syntax:remove ssh public-key user=<xx> type={dsa | rsa | both}Description:Removes the public-key from a specified user.Example:C1|S3|L1D> remove ssh public-key user=guest type=dsa
C1|S3|L1D>

Set SSH Authentication Retry

Syntax:	set ssh auth-retry= <xx></xx>
Description:	Defines the number of times (1–5) that a user can retry a failed authentication, such as trying to correct a wrong password. The SSH server terminates the connection when the limit is exceeded.
Example:	C1 S3 L1D> set ssh auth-retry ? <1-5> C1 S3 L1D> set ssh auth-retry 3 C1 S3 L1D>

Note: The SSH server state must be enabled before this command has an effect.

Set SSH Public Key to a User

Syntax:	<pre>set ssh public-key user=<xx> type={dsa rsa} file=<yy></yy></xx></pre>	
Description:	Sets the public key to a user from a key file. This file should first be obtained by doing either a TFTP or FTP get command.	
	where:	
	xx = user name used to login to SSH	
	yy = name of the file that contains the public key	
Example:	C1 S3 L1D> set ssh public-key user=1 type=dsa file=certfile	
	Invalid user! C1 S3 L1D> set ssh public-key user=root type=dsa file=certfile Set SSH public key failed.	
	C1 S3 L1D> set ssh server state=enable C1 S3 L1D> set ssh public-key user=root type=dsa file=certfile C1 S3 L1D	

Set SSH Server State

Syntax:	set ssh server state={enable disable}		
Description:	Enables or disables the secure shell server state.		
Example:	C1 S3 L1D> set ssh public-key user root type dsa file certfile		
	Set SSH public key failed.		
	C1 S3 L1D>set ssh server state ?		
	disable		
	enable		
	C1 S3 L1D> set ssh server state=enable		
	C1 S3 L1D> set ssh public-key user=root type=dsa file=certfile		
	C1 S3 L1D>		

Set SSH Timeout

Syntax:	set ssh client timeout= <xx></xx>
Description:	Defines the maximum number of seconds (1–120) that protocol negotiation, including user authentication, can take before the SSH server terminates the connection.
Example:	<pre>C1 S3 L1D>set ssh client timeout ? <1-120> C1 S3 L1D>set ssh client timeout=15 Fail to set SSH client timeout! C1 S3 L1D>set ssh server ? state C1 S3 L1D>set ssh server state ? disable enable C1 S3 L1D>set ssh server state disable C1 S3 L1D>set ssh client timeout 15 C1 S3 L1D>set ssh client timeout 15 C1 S3 L1D></pre>

Note: The SSH server state must be enabled before this command has an effect.

Show SSH Configuration

Syntax:	show ssh config		
Description:	Displays the configuration of the secure shell.		
Example:	Agent III C1 S1 L1D> show ssh config		
	Secure Shell configuration:		
	Secure shell server state:	disable	
	Secure shell version:	2.0	
	Secure shell time out:	60	
	Secure shell authentication retries:	3	
	Agent III C1 S1 L1D>		

Show SSH Public Key of a User

Syntax: show ssh public-key user=<xx>

Description: Displays the secure shell public key of a specified user.

Example: C1|S13|L1D/>**show ssh public-key user=root**

RSA public key: 00 00 00 00 00 00 00 00 00 00 DSA public key: 00 00 00 00 00 00 00 00 00 00 00 C1|S13|L1D/>

Show SSH Host Key

Syntax: show ssh host–key

Description: Displays both the DSA and RSA host keys.

Example:

Host-key generated!
C1|S16|L1D>show ssh ?
 config
 host-key
 public-key
C1|S16|L1D>show ssh host-key
RSA host key:

00 00 00 07 73 73 68 2d 72 73 61 00 00 00 03 01 00 01 00 00 00 83 00 b7 9e 1f 3f 31 3f 7d 0c 90 90 83 69 ec 65 4e c0 bb a9 87 ae eb 16 7f fc f7 27 d0 f7 a9 3e 0 a 03 07 71 14 8b 6f 96 4a 47 62 f9 13 c3 62 de 82 73 b7 67 6d a6 26 a2 b4 42 3d 9f 4f 89 5f f2 b2 59 b6 83 0b b0 c3 ed db d4 23 c2 9f 71 55 58 4f 0b 51 f4 67 1b cd 50 75 4c 4b a9 42 27 99 f1 d8 97 77 4a ce a3 47 a8 2f 5d 95 8d 9e a3 d7 cb 9 c 9d 35 ae c0 d6 d4 d8 08 8e 89 10 90 35 82 28 ce 77 42 1b 00 00 00 82 32 ed 5f 5b 46 8c 86 61 72 c3 32 3f b1 ba 53 82 6f 4a 51 00 b9 e1 6e b4 39 d4 c8 47 b8 a0 25 64 bb ae a8 75 18 09 06 27 10 93 66 e0 dd 4e 3b be 5e 93 08 3d 7a 1f cc 81 4 6 d8 25 d6 43 4f 6c 1a 27 65 94 72 bb e8 c0 1b f7 ba 41 d4 98 f4 02 8f ef 5f 45 47 aa 23 80 92 9f ef ae 2f f0 87 0e 46 e8 f8 0a 76 11 73 73 3e c0 ce a8 03 a2 46 9a 29 86 81 06 e5 98 a4 f1 01 ac d3 3e 76 91 dc 4b 93 b7 71 00 00 00 42 00 d2 4 a 84 8a e2 11 38 80 ec 7a b3 1e 9f 5e 12 7a d3 0b a5 55 04 49 13 d1 0b 58 bc 22 59 5e 2e 59 fe e6 8f 90 22 da 99 12 8d 39 57 a0 7a d7 ef 56 17 a5 27 e8 30 07 45 44 e9 9f 40 cd a9 c1 36 aa 33 00 00 00 42 00 df 87 61 fd 4f 64 a1 b1 c3 18 2e b 0 82 8e 87 0b 72 ce f3 46 28 38 95 97 eb b9 01 59 aa f1 d7 54 8c 34 f1 ca 57 ed f0 7e 96 6b 0a 2f fd 17 35 43 d8 36 2a 80 66 b0 89 14 fc a1 30 30 b0 44 ab f0 79

System Logging (Syslog) Commands

Syslog can be used for system management and security auditing, as well as generalized information, analysis, and message debugging. It is supported by a wide variety of devices and receivers across multiple platforms. Because of this, Syslog is used to integrate log data from many different types of devices into a central repository. The syslog protocol conveys event notification messages using a layered architecture, allowing a variety of transport protocols, and providing a message format of vendor-specific extensions to be provided in a structured way.

Syslog messages refer to a facility (auth, authpriv, daemon, cron, ftp, lpr, kern, subagent, bpd_linux, syslog, user, uucp, local0 - local7) that are assigned a priority/level (Emergency, Alert, Critical, Error, Warning, Notice, Info, or Debug) by the sender of the message. Configuration allows directing messages to various local devices (console), files, ports, or remote syslog daemons. **Note**: Take care when updating the configuration; omitting or misdirecting message facility.level can cause important messages to be ignored by syslog or overlooked by the administrator.

Messages used to enable debugging or software testing are assigned Severity 7. Severity 0 is reserved for messages of very high importance (e.g., serious hardware failures or imminent power failure). Refer to your organizations policy administrator for this level of severity.

Note that the syslog protocol does not provide for acknowledgment of message delivery.

Set Syslog Configuration

Command: Description:	set syslog Device level commands used to define Syslog operations (the Syslog server address and port, and Syslog level and mode). When syslog svr type=ipv4 , enter an IP address, like 192.168.0.2; when syslog svr type=dns , enter a hostname. The default is set syslog mode=off .
Syntax:	set syslog svr port=<1-65535> <cr> set syslog mode=(local remote localAndRemote off) <cr> set syslog level=(emerg alert crit err warning notice info debug) <cr> set syslog svr type=(ipv4 dns) addr=SYSLOG_SVR_ADDR <cr></cr></cr></cr></cr>
Example:	C1 S3 L1D> set syslog set syslog svr addr=192.168.1.30 C1 S3 L1D> set syslog set syslog svr port=667 C1 S3 L1D> set syslog set syslog level=err C1 S3 L1D> set syslog set syslog mode=LocalandRemote C1 S3 L1D>
Defaults:	Syslog Server Address default: 192.168.0.2 Server Port default: port # 514 Level default: Notice Mode default: Log local

<u>Note</u> : The set syslog svr type command accepts an IPv4, IPv6, or DNS Syslog server type. Use the Linux commands "cd /var/log" and "cat sys.log" to view the log.

Example:	
Agent III C1 S1 L1D> show syslog config	
Syslog server address type:	dns
Syslog server address:	0.0.0
Syslog server port:	1
Syslog level:	notice
Syslog mode:	local
Agent III C1 S1 L1D>set syslog svr type	e=ipv4 addr=192.168.1.30
Agent III C1 S1 L1D>set syslog svr type	=ipv6 addr=fe80::2c0:f2ff:fe20:de9e
Arent TTT C1 C1 L1D, show avalar are Circ	
Agent III C1 S1 L1D> show syslog config	
Syslog server address type:	ipv6
	ipv6 fe80::2c0:f2ff:fe20:de9e
Syslog server address type:	•
Syslog server address type: Syslog server address:	fe80::2c0:f2ff:fe20:de9e
Syslog server address type: Syslog server address: Syslog server port:	fe80::2c0:f2ff:fe20:de9e 1

Agent III C1/S9/L1D>cd /var/Log Agent III C1/S9/L1D>cat sys.log Dec 31 19:00:35 (none) user.notice syslog: attach platform info in shared memory at 0x40006000 Dec 31 19:00:39 (none) local5.err bpd_linux[734]: BPD ERROR: the application dsa p 10 is released already. Parameter Descriptions:

Server Address - The address of the Remote Syslog server (e.g., 192.168.0.2 above).

Server Port – The remote syslog server listening port. The default is port <u>514</u>. The valid range is port numbers 1-65535.

Level – One of eight Syslog message severity levels. The enumeration values are equal to the values that syslog uses + 1; a messages with a severity level lower than or equal to this level will be logged.

Emergency	Emergency; system is unusable (most critical)
Alert	Action must be taken immediately
Critical	A critical condition exists
Error	Error condition
Warning	Warning condition
Notice	Normal but significant condition (the default setting)

Info Debug	Informational message Debug-level messages (least critical)		
Mode – The current Syslo	g operating mode {" <i>Local</i> ", " <i>Remote</i> ", " <i>Local and Remote</i> ", "Off"}:		
Log local Log Remote	Syslog messages are only saved to local device; Syslog messages are only sent to remote server;		
Log Local and Remo	Syslog messages are saved to a local device and sent to the Syslog		
Off	Do not save syslog messages. The Syslog function is disabled.		

Show Syslog Configuration

Command: show syslog config

Device level command to display the current Syslog configuration, including the Syslog Description: server address and port, and the Syslog level and mode.

Syntax: show syslog config <cr>

Example:	C1 S8 L1D> show syslog config	
	Syslog server address type:	ipv4
	Syslog server address:	192.168.0.2
	Syslog server port:	514
	Syslog level:	info
	Syslog mode:	local
	C1 S8 L1D>	

Command:	Clear Syslog Records\n
Syntax:	clear syslog
Description:	Device level command to erase all existing records on the configured Syslog server.
Example 1:	Agent III C1 S1 L1D> clear syslog Agent III C1 S1 L1D>

Messages:

Error: this command should be executed on a device! System is busy, please retry this command later! Syslog is not supported on this card! (only available in FBRM card)

Example 2:

Agent III C1 S1 L1D> cd /var/log

TACACS+ Commands

TACACS+ (Terminal Access Controller Access Control System) provides routers and access servers with authentication, authorization and accounting services. TACACS+ is used along with or as a replacement for RADIUS. TACACS+ uses the Transmission Control Protocol (TCP) and RADIUS uses the User Datagram Protocol (UDP). Some administrators recommend using TACACS+ because TCP is seen as a more reliable protocol. While RADIUS combines authentication and authorization in a user profile, TACACS+ separates the authentication and authorization operations.

By default, Tacplus listens on TCP port 49 and provides network devices with authentication, authorization and accounting services (AAA).

Note that when refreshing the TACACS+ page, all shared secrets display as "*******". This is by design for all types of passwords. This is typically caused by adding letters after the "*" and then refreshing the page.

After a refresh, just '******' displays instead of the password which was previously set. Thus after refresh, if you add some letters following the previous password (actually is '******' now), the '******' and added letters will be saved. This is the standard mechanism for all passwords in the ION web interface.

The TACACS+ commands for an IONMM or a standalone SIC are described below.

	S+ Client State			
set tacplus client state=(enable disable)				
Device level command used to enable or disable logging in to the ION system using TACPLUS (TACACS+). Execute this command on an IONMM or a standalone SIC only.				
where:				
enable = the TACACS+ client is enabled and logging in to the ION system via TACACS+ is re- quired.				stem via TACACS+ is re-
disable = th	ne TACACS+ client is d	isabled and logging in to	the ION s	ystem.

Messages:

Error: this command should be executed on a device! Error: this command should be executed on IONMM or a standalone SIC!" Error: The parameter is wrong! Fail to set TACPLUS client state!

Command:	Set TACPLUS Server Retry Value		
Syntax:	set tacplus svr=<1-6> retry=<1-5>		
Description:	Device level command to define the TACACS+ server index number and retries parameter. Make sure the command is entered on an IONMM or a standalone SIC.		
	where:		
	svr = a configured TACACS+ server in the range of 1-6.		
	retry = the number of attempts to connect to this server, in the range of 1-5 retries. Resend the connect request this many times before trying to connect to the next TACACS server.		
Example:	Agent III C1 S1 L1D> set tacplus svr=1 retry=3 Agent III C1 S1 L1D>		

Messages:

Error: this command should be executed on a device! Error: this command should be executed on IONMM or a standalone SIC! Please input a digital number to specify radius server index! Please input a digital number to specify RADIUS server retry! TACPLUS authentication server index is out of range!

Command: Set TACPLUS Server Timeout Value

Syntax: set tacplus svr=<1-6> timeout=<1-60>

Description: Device level command to define the amount of time (in seconds) to wait for a reply from a

TACACS+ server before trying the next server. Make sure the command is entered on an IONMM or a standalone SIC.

where:

svr = a configured TACACS+ server in the range of 1-6.

timeout = the amount of time (in seconds) to wait for a reply from a TACACS server before trying another server.

Example: Agent III C1|S1|L1D>set tacplus svr=1 timeout 25 Agent III C1|S1|L1D>

Messages:

Error: this command should be executed on a device! Error: this command should be executed on IONMM or a standalone SIC! Fail to set TACPLUS server time out! Please input a digital number to specify tacplus server index! Please input a digital number to specify tacplus server time out! TACPLUS authentication server index is out of range! TACPLUS server time out is out of range!

Command:	Set TACPLUS Server Secret
Syntax:	set tacplus svr=<1-6> secret=SECRET
Description:	Device level command to define a specific TACACS+ server's secret (password). This is a string well known to both client and server and is used to validate and/or encrypt data, transmitted between them. Make sure this command is entered on an IONMM or a standalone SIC.
	where:
	svr = a configured TACACS+ server in the range of 1-6.
	secret = the TACACS+ AAA password to connect with a TACACS server. Alpha, numeric, and special characters are allowed. Do <u>not</u> enter any space characters.
User Level:	Admin user login user level required.
Example:	Agent III C1 S1 L1D> set tacplus svr=1 secret=123about time
	% Unknown command.
	Agent III C1 S1 L1D> set tacplus svr=1 secret=123abouttime
	Agent III C1 S1 L1D>

Note: After refreshing the page, all shared secrets will be "*******". This is by design for most types of password applications. This is also caused by adding letters after the "*" after refreshing the page. After a refresh, just '*******' is returned instead of the actual password which was entered previously. So after refresh, any characters added following the previous password (actually is '*******' now), the '******' and added characters will be saved.

Messages:

Error: this command should be executed on a device! Error: this command should be executed on IONMM or a standalone SIC! Please input a digital number to specify TACPLUS server index! Set TACPLUS server secret TACPLUS authentication server index is out of range! The TACPLUS authentication server specified does not exist! Command: Set a TACPLUS Server / Type / Address / values

Syntax: set tacplus svr=<1-6> type=(ipv4 |ipv6|dns) timeout=

Description: Device level command to define a specific TACACS+ server in terms of its server IP addressing method, number of retries, and timeout value. The TACACS server must be up and running and configured properly. Make sure the command is executed on IONMM or a standalone SIC.

<u>where</u>:

svr = TACACS+ server index number (1-6). A configured TACACS+ server in the range of 1-6.

svr-type = The TACACS+ Server address type (ipv4 |ipv6|dns).

type = the TACACS+ server's IPv4, IPv6 or DNS address, in the correct syntax for the type of addressing used.

timeout = the amount of time (1-60 seconds) to wait for a reply from a TACACS server before trying another server.

retry = the number of attempts to connect to this server, in the range of 1-5 retries (optional). Resend the connect request this many times before trying the next TACACS server.

Example:

```
Agent III C1|S1|L1D>set tacplus svr 1 type ipv4 addr 192.168.1.30 1
Wrong parameter number!
Agent III C1|S1|L1D>set tacplus svr 1 ?

Error: this command should be executed on IONMM or a standalone SIC! Fail to get system user name!") Getting TACPLUS server fail Invalid IP address!

When you hit **Save** after any TACACS+ re-configuration, a re-login is required; the message "*The TACACS+ settings* have been changed and a re-login will be performed right now."

Command: Set Login Method

Syntax: **set login method**=(local|radiuslocal|tacpluslocal|radiustacpluslocal|tacplusradiuslocal)

Description: Sets the desired login method. If more than just "local" login is required, sets the login sequence (order of login validation). Type **set login method**=type,

where **type** = (local|radiuslocal|tacpluslocal|radiustacpluslocal|tacplusradiuslocal):

local = the ION software will validate the local login only.

radiuslocal = the ION software will validate the RADIUS login and then the local login.

radiustacpluslocal = the ION software will validate the RADIUS login, then the TACACS+ login, and then the local login.

tacpluslocal = the ION software will validate the TACACS+ login and then the local login.

tacplusradiuslocal = the ION software will validate the TACACS+ login, then the RADIUS login, and then the local login.

Example:

```
Agent III C1|S1|L1D>set login method ?
local
radiuslocal
radiustacpluslocal
tacpluslocal
Agent III C1|S1|L1D>set login method radiustacpluslocal
Agent III C1|S1|L1D>set login method local
Agent III C1|S1|L1D>
```

Message: *The TACACS+ settings have been changed and a re-login will be performed right now.* **Meaning**: When you hit **Save** after any TACACS+ re-config a re-login is required. **Recovery**:

1. Log back in to the system. See "TACACS+ Commands" on page 111.

2. Enter the **show tacplus config** command and verify the TACACS+ configuration settings.

TACACS+ Messages

Error: The parameter is wrong! Error: this command should be executed on a device! Error: this command should be executed on IONMM or a standalone SIC!" Fail to get system user name! Please input a digital number to specify radius server index! Please input a digital number to specify RADIUS server retry! *Please input a digital number to specify tacplus server time out!* Please input a digital number to specify TACPLUS server retry! *Please input a digital number to specify TACPLUS server time out!* Please input a digital number to specify tacplus server index! *Please input a digital number to specify TACPLUS server index!* Please input a number to specify the TACPLUS server index! Set TACPLUS server secret TACPLUS authentication server index is out of range! TACPLUS server retry is out of range! TACPLUS server time out is out of range! The ipv6 address is multicast address The TACPLUS authentication server specified does not exist! Wrong parameter number! Meaning: You entered a TACACS+ (Tacplus) command, but the command was unsuccessful. Recoverv:

1. Make sure you enter the TACACS+ command on an IONMM or a standalone SIC at the device level.

- 2. Make sure the TACACS+ client is enabled and that the TACACS+ server is correctly configured and running.
- 3. Make sure you enter the command parameters within the valid ranges and in the proper syntax. See "TACACS+

Commands" on page 111.

4. Check the RADIUS configuration.

- 5. Retry the command. See the related manual or section.
- 6. Check your third party TACACS+ server documentation and helps (e.g., ClearBox Server, etc.).
- 7. If the problem persists, contact Technical Support.

TACACS+ Syslog Messages

Tacplus logs error messages to syslog, and informational messages to facility LOG_LOCAL6. Debug messages are not sent to syslog. Note that that syslogd provides little in the way of diagnostics when it encounters errors in the *syslog.conf* file.

syslog (LOG_ERR, "error sending auth req to TACACS+ server")

syslog(LOG_ERR, "error sending continue req to TACACS+ server")

syslog (LOG_ERR, "auth failed: %d", msg)

syslog (LOG_ERR, "auth failed: %d", msg)

syslog (LOG_INFO, "Tacplus daemon fail to get message from messageQ.")

"STATUS_INVALID, should be session reset, Reregister from begining\n"

"Fail for sending ionDevSysUserLoginMethodObjects,ignored...\n"

"Number of subid is not correct when ionDevSysUserLoginMethodObjects_com, expect %d, get %d n"

"agentx_mapset Error"

"agentx_ot_add Error"

TNDP Commands

TNDP (TN Topology Discovery Protocol) is the Lantronix implementation of LLDP. When set to Enabled, the device entering this command will no longer be discovered by the IONMM if it is remotely managed through this port.

If using the NID with a switch or router, the NID continues to send out LLDP-based information (proprietary - sent once every second). While this does not impact the data traffic seen, it drops for unrecognized upper-level protocols in the switch / router. Disabling TNDP can help eliminate invalid errors and make troubleshooting simpler. This ability to enable or disable MAC learning is supported via the Web interface and the CLI.

Note: The traffic related to remote management on these converters is transmitted in-band and is unnecessary on customer facing ports, therefore the TN Topology Discovery Protocol TX should be disabled on these ports. The TN Topology Discovery Protocol TX should only be enabled on the port that is the uplink port, back to another x222x or x322x card in an ION chassis that is utilizing the IONMM management module.

Set TNDP (TN Topology Discovery Protocol) State

Command: **set tndp**=<enable|disable>

Description:Port level command to enable or disable the TN topology discovery protocol on a port.
This is TN's LLDP implementation. When set to Enabled, the device entering this
command will not be discovered by the IONMM if it is remotely managed through this
port.
If enabled, TN Topology Discovery Data will be sent out from this interface.
If disabled, TN Topology Discovery Data will not be sent out from this interface.
The default is enabled.Syntax:set tndp tx state=<enable|disable><cr>

Example: C1|S3|L1P2>set tndp tx state=enable C1|S3|L1P2>

Show TNDP (TN Topology Discovery Protocol) State

Command:	show tndp tx state
Description:	Displays the current setting (Enabled or Disabled) of the TN topology discovery protocol on a port. When Enabled, the device is not being discovered by the IONMM if the device is remotely managed through this port. If enabled, TN Topology Discovery Data <u>will</u> be sent out from this interface. If disabled, TN Topology Discovery Data will <u>not</u> be sent out from this interface.
_	
Syntax:	show tndp tx state <cr></cr>

C1 S3 L1P1>show tndp tx state	
TNDP Tx state:	enable
C1 S3 L1P1>go l1p=2	
C1 S3 L1P2> show tndp tx state	
TNDP Tx state:	enable
C1 S3 L1P2>	

TFTP Transfer / Upgrade Commands

TFTP is a simple protocol used to transfer files. A TFTP client needs the IP address entered in one action. The TFTP server can be an IPv4 address, an IPv6 address or a DNS name, but only the latest TFTP IP address or DNS name can be saved. If IPv6 is disabled and the TFTP server address is an IPv6 address, the server can not be used. In this case you must change the TFTP server either to an IPv4 address or a DNS name.

The Trivial File Transfer Protocol (TFTP) can be used to transfer files between the IONMM or a standalone local NID and a TFTP server. These commands are available to Admin level login users only. **Note**: A TFTP server must be online, configured and operational.

The following commands are used for TFTP operations.

TFTP Get	
Command:	TFTP Get
Syntax:	tftp get iptype=(ipv4 ipv6 dns) ipaddr=ADDR remotefile=RFILE [localfile=LFILE]
Description:	This command gets (downloads) a file from a TFTP server, <u>where</u> :
	iptype = the type of IP addressing to be used (IPv4, IPv6, or DNS).
	ipaddr = the TFTP server's IPv4 or IPv6 address. This TFTP server must be configured and running.
	remotefile = the name of the remote file to be transferred with a .bin suffix.
	localfile = the name of the local file when transferred (optional) with a <i>.bin</i> suffix.
Example:	<pre>Agent III C1 S1 L1D>tftp get iptype ? ipv4 ipv6 dns Agent III C1 S1 L1D>tftp get iptype ipv4 ipaddr 192.168.1.30 remotefile x323x_0.8.5_AP.bin TFTP transferring Agent III C1 S1 L1D> Usage: tftp get iptype=(ipv4 dns) ipaddr=ADDR remotefile=RFILE [lo- calfile=LFILE]</pre>
Example [.]	

Example:

C1|S3|L1D>tftp get iptype=ipv4 ipaddr=192.168.1.30 remotefile=cert localfile=cert TFTP transferring...

File transfer successful!

TFTP Put

Command: **TFTP Put**

Syntax: tftp put iptype=(ipv4|ipv6|dns) ipaddr=ADDR localfile=LFILE [remotefile=RFILE]

Description: This command puts (uploads) a file to a TFTP server. This server must be configured and running, <u>where</u>:

iptype = the type of IP addressing to be used (IPv4,IPv6, or DNS).

ipaddr = the TFTP server's IPv4 or IPv6 address. This TFTP server must be configured and running.

remotefile = the name of the remote file to be transferred with a *.bin* suffix.

localfile = the name of the local file when transferred (optional).

Example: Agent III C1|S1|L1D>tftp put iptype ipv4 ipaddr 192.168.1.30 localfile x323x_0.8.5_AP.bin TFTP transferring... Fail to transfer the file! Agent III C1|S1|L1D>tftp put iptype ipv6 ipaddr fe80::2c0:f2ff:fe20:de9e localfile IONMM_0.8.5_AP.bin TFTP transferring... Fail to transfer the file! Agent III C1|S1|L1D>

TFTP Upgrade

Command:	TFTP Update
Syntax:	tftp upgrade iptype=(ipv4 ipv6 dns) ipaddr=ADDR remotefile=RFILE
Description:	This command gets (downloads) a file from a TFTP server. The TFTP server must be configured and running, <u>where</u> :
	iptype = the type of IP addressing to be used (IPv4,IPv6, or DNS).
	ipaddr = the TFTP server's IP address. This server must be configured and running. remotefile = the name of the remote file to be transferred with a .bin suffix.
Example:	Agent III C1 S1 L1D> tftp upgrade iptype ipv4 ipaddr 192.168.1.30 remotefile IONMM_0.8.5_AP
	<pre>Processing TFTP transfer failed! Agent III C1 S1 L1D>tftp upgrade iptype ipv4 ipaddr 192.168.1.30 remote- file IONMM_0.8.5_AP.bin Processing TFTP upgrade succeeded!</pre>

Prov Get TFTP Server Address

Command:	Set TFTP Server
Syntax:	prov set tftp svr type=(ipv4 ipv6 dns) addr=ADDR
Description:	This command sets the current TFTP server type and address, <u>where</u> :
	type = the type of IP addressing (IPv4, IPv6 or DNS).
	addr = the TFTP server's IP address (IPv4, IPv6 or DNS server address).
Mode:	Global mode
Example:	Agent III C1 S1 L1D> prov set tftp svr type ipv4 addr 192.168.1.30 Agent III C1 S1 L1D>

Prov Set TFTP Server Type

Syntax: prov set tftp svr type=(ipv4|ipv6}dns) addr=ADDR

Description: Provision the TFTP Server type and address. Available to an Admin level login user only.

where:

x = type = (ipv4|ipv6|dns)y = addr = ADDR

Example: Agent III C1|S1|L1P1>prov set tftp svr type ? ipv4 ipv6 dns Agent III C1|S1|L1P1>prov set tftp svr type ipv4 addr 192.168.1.10 Agent III C1|S1|L1P1>prov set tftp svr type ipv6 addr e80::2c0:f2ff:fe20:de9e Agent III C1|S1|L1P1>

Upgrade / Update Firmware Commands

Note: These commands can only be entered at the device level - when the last part of the command line prompt indicates the location is a device (L1D, L2D or L3D).

Show Firmware Database Update Results

- *Syntax:* show firmware-db update result
- *Description:* Displays the results of the "Update Firmware Database" command (whether or not the update was successful). If the update failed, this command will display the reason. This command must be entered from the IONMM card.

Example 1:	C0 S0 L1d/> show firmware-db u	pdate result
	Database file name:	binary.zip
	Database update result:	failure
	Database update fail reason:	invalid input file

Example 2:	C1 S5 L1P2>show firmware-db u	pdate result
	Upgrade is only supported on	IONMM card!
	C1 S5 L1P2>home	
	C1 S7 L1D>show firmware-db up	date result
	Database file name:	IONMM.bin.1.1.0.zip
	Database update result:	success
	C1 S7 L1D>	

Example 3:	C1 S7 L1D> show firmware-db update result Database file name: x323x.bin.1.1.0 Database update result: success
<i>Example 4</i> :	Agent III C1 S1 L1D> show firmware-db update result
Example 4.	Agent III CI SI LID>Show FIRmware-ub update result Database file name: Database update result: none Agent III C1 S1 L1D>

Show Firmware Upgrade Results

Syntax: show firmware upgrade result

Description: Displays the results of the most recent "**upgrade module**" command (in progress, success, failure, etc.).

If the result is "failure", a reason is provided, such as 'no firmware' at a newer version is available.

If the firmware upgrade was successful, the *time started* and *time completed* display. This upgrade command is only supported from the IONMM.

Example 1 (5 modules successfully updated):

C1 S7	L1D>show firmware upgr	rade resul	t		
index	module	status	reason	time started	time completed
T	C3230-1040 c=1 s=3 l1c			00:51:15	00:54:16
2	C3230-1040 c=1 s=5 l10	success		00:51:15	00:54:06
3	C3231-1040 c=1 s=10 l1	Ld success		00:51:15	00:56:50
4	C2220-1014 c=1 s=16 l1	Ld success		00:51:15	00:55:59
5	C3220-1040 c=1 s=18 l1	Ld success		00:51:15	00:54:09
6				00:00:00	00:00:00
7				00:00:00	00:00:00
8				00:00:00	00:00:00
C1 S7	L1D>				

Example 2 (7 modules successfully updated, 1 failed):

C1 S7 L11 index	>> show firmware upgrade result module	status	reason	time started time completed
1	C3230-1040 c=1 s=3 l1d	success		00:22:3900:25:54
2	C3230-1040 c=1 s=5 l1d	success		00:22:3900:28:33
3	card registering	success		00:22:3900:25:41
4	C3231-1040 c=1 s=10 l1d	success		00:22:39 00:26:05
5	C2210-1013 c=1 s=13 l1d	failure	no firmware	00:22:3900:22:39
6	C2220-1014 c=1 s=16 l1d	success		00:22:39 00:25:28
7	C3220-1040 c=1 s=18 l1d	success		00:22:3900:26:28
8	IONPS-A c=1 s=22 lld	success		00:22:3900:22:46
C1 S7 L1)>			

If a module upgrade was unsuccessful, the reason for the failure displays in the "reason" column of the table (e.g., *invalid input file*, *protocol timeout*). See "Appendix C: CLI Messages" on page 207 for error messages and recovery procedures.

Show Upgrade File Name

Syntax: show upgrade firmware file

Description: Displays the name of the upgrade files. This upgrade is only supported on the IONMM.

Example 1:

C1 S7 L1D> show upgrade firmware file			
Card type	Revision	Firmware file name	
IONMM	1.0.5	IONMM_1.0.5_AP.bin	
x222x_x322x	1.0.5	x222x_x322x_1.0.5_AP.bin	
x323x	1.0.5	x323x_1.0.5_AP.bin	
C1 S7 L1D>			

Example 2:

C1 S7 L1D>show upgrade fi	irmware file	
Card type	Revision	Firmware file name
x211x	1.0.4	C2110_1.0.4_AP.bin
x323x	1.0.4	x323x_1.0.4_AP.bin
x321x	1.0.4	C3210_1.0.4_AP.bin
ION219	1.0.4	ION219_1.0.4_AP.bin
IONMM	1.0.4	IONMM_1.0.4_AP.bin
x311x	1.0.4	C3110_1.0.4_AP.bin
x222x_x322x	1.0.4	x222x_x322x_1.0.4_AP.bin
IONPS	1.0.4	IONPS_1.0.4_AP.bin
x221x	1.0.4	C2210_1.0.4_AP.bin
C1 S7 L1D>		

Example 3:

C1 S1 L1D>show upgrade firm	ware file	
Card type	Revision	Firmware file name
x621x	0.6.2	C6210-0.6.2.bin
x222x_x322x	0.6.3	x222x_x322x-0.6.3.bin
x323x	0.6.3	x323x-0.6.3.bin
x601x	0.6.3	C6010_0.6.3_AP.bin
C1 S1 L1D>		

Messages:

Error: Upgrade is only supported on IONMM card! No upgrade firmware files now!

Update Firmware Database

Note: You must use the "tftp get" command to copy the upgrade file from the TFTP server to the IONMM or standalone module. See "TFTP Commands" on page 157.

Upgrade Device Firmware

Syntax: upgrade module

Description: Causes the firmware in the device selected in the command line prompt to be upgraded. This upgrade is only supported on the IONMM.

Doing a reboot, restart or upgrade of the IONMM, a power restart of the chassis, or a reset to factory settings may cause some configuration backup files, HTTPS certification file, SSH key file, and Syslog file to be lost.

Example:	C1 S7 L1D> upgrade module Available modules:		
	index	module	loc
	1	ION219	c=1 s=0 l1d
	2	C3230-1040	c=1 s=3 l1d
	3	C3230-1040	c=1 s=5 l1d
	4	IONMM	c=1 s=7 l1d
	5	C3231-1040	c=1 s=10 l1d
	6	C2110-1013	c=1 s=12 l1d
	7	C2210-1013	c=1 s=13 l1d
	8	C2220-1014	c=1 s=16 l1d
	9	C3220-1040	c=1 s=18 l1d
	10	IONPS-A	c=1 s=22 l1d

Choose the module you want to upgrade: (eg. 1,3,16; at most 8 modules to upgrade, press 'q' to exit upgrade)

Select one or more modules to upgrade by entering the displayed index number (e.g., 1, 3, 6) and press **Enter**. The message *"processing ..."* displays.

Note: It may take some time to finish the task; you can continue with other work, then use "**show firmware upgrade result**" to check result.

If the firmware upgrade was successful, the time started and time completed display.

If a module upgrade was unsuccessful, the reason for the failure displays in the "reason" column of the table (e.g., *invalid input file*, *protocol timeout*). See "Section 5 – Troubleshooting" on page 201 for error messages and recovery procedures.

VLAN Commands

The VLAN commands can be divided into three categories:

- Management VLAN commands
- Device-level VLAN commands and Port-level VLAN commands
- Device-level VLAN Database commands and Port-level VLAN Database commands

<u>Device</u>-level commands can only be entered when the last part of the command line prompt indicates the location is a device (L1D, L2D or L3D).

<u>Port</u>-level commands can only be entered when the last part of the command line prompt indicates the location is a port (LxPx; where x is 1, 2 or 3).

Only the Management VLAN commands are applicable for the IONMM or NID. The device-level and port-level Management VLAN commands do not function when entered from an IONMM or NID.

The following configuration restrictions apply to the Management VLAN feature:

- Management VLAN Status can not be changed to "Enabled" with VLAN "1" and valid VLAN ID allowed is "2 to 4094". However, VLAN "1" can be selected when Management VLAN status is set to "Disabled". Thus:
 - a VLAN ID of 2-4094 is valid with Management VLAN enabled.
 - a VLAN ID of 1-4094 is valid with Management VLAN disabled.
- 2) Management VLAN status can not be changed to "Enabled" when no port members are selected.
- 3) Management VLAN Status "Disabled" means that Management access is allowed on all the ports; the values in Management VLAN ID and port members are ignored.
- 4) Management VLAN can be enabled in "Network" mode or "Provider" mode. Before adding the ports for Management VLAN, set the Frame Tag mode of that port to "Network". When Provider tagging is required in that port, then set the Frame Tag mode to "Provider".
- 5) Port members cannot be checked without first enabling "Network/Provider" mode on those ports.
- 6) The card must be in "Network" mode to set the VLAN ID. If it is not set to "Network", an SNMP operation error displays.
- 7) A port with its Frame Tag mode set to "Customer" (default) can not be added to Member Ports for Management VLAN.

The Management VLAN default values are:

- VLAN ID: 2
- Port members checked: none
- Status: Disabled

Management VLAN Commands

Set Management VLAN Admin State

Syntax: set mgmt vlan state={enable | disable}

Description: Enables or disables management VLAN for the NID.

Example: C0|S0|L1D>set mgmt vlan state enable C0|S0|L1D>

Set Management VLAN ID

Syntax: set mgmt vlan vid=<xx>

Description: Defines the management VLAN ID (2–4094) that the NID is associated with.

Example:	C0 S0 L1D> set mgmt vlan vid 6
	C0 S0 L1D>

Set Management VLAN Port(s)

Syntax: set mgmt vlan port=<xx>

Description: Specifies the port(s) on the IONMM or NID that will be part of the management VLAN. If more than one port is specified, they must be separated by a comma (i.e., port=1,2). where:

xx = port number(s) (e.g., port=1 or port=1,2)

 Example:
 C1|S7|L1D>set mgmt vlan port=1

 C1|S7|L1D>set mgmt vlan port=2

 C1|S7|L1D>

Show Management VLAN Configuration

<i>Syntax:</i> show mgmt vlan confi	g
-------------------------------------	---

Description: Displays the management VLAN configuration of a NID.

Example 1:	C1 S7 L1D	>show mgmt vlan conf	ig
	vlan id	vlan state	vlan portlist
			4.2
	100	enable	1,2

Example 2:	C1 S7 L1D	>set mgmt vlan port=	1
	C1 S7 L1D	>set mgmt vlan port=	2
	C1 S7 L1D	>show mgmt vlan conf	ig
	vlan id	vlan state	vlan portlist
	3	disable	1,2
	C1 S7 L1D	l>	

VLAN Device-Level Commands

Note: These commands can only be entered at the device level - when the last part of the command line prompt indicates the location is a device (L1D, L2D or L3D).

Add VLAN VID

Syntax:	add vlan vid=<2-4094> [priority=NUM] [pri-override=(enable disable)]		
Description:	Create a new VLAN and assign a VLAN ID to it, where:		
	 Vlan-id = 2-4094 = a number to uniquely identify a VLAN, in the range of 2 to 4094. VID 1 is reserved for the default VLAN and cannot be assigned or changed. [pri-override = (enable disable)] optional parameter to include or exclude priority override capability. This command can be entered by users with admin or read-write user privileges. 		
Example:	AgentIII C1 S8 L1D>add vlan vid 2 AgentIII C1 S8 L1D>show vlan config vid:1 fid:0 priority:0 priv_override:disable port1: noMod port2: noMod port3: noMod vid:2 fid:0 priority:0 priv_override:disable port1: notMember port2: notMember port3: notMember AgentIII C1 S8 L1D>		

Remove VLAN VID

Syntax:	remove vlan vid=<2-4094> [priority=NUM] [pri-override=(enable disable)]
Description:	Remove a specified VLAN from a card, where: Vlan-id = a number that identifies a VLAN (2 to 4094). VID 1 is reserved for the default VLAN and cannot be assigned or changed. This command can be entered by users with admin or read-write user privileges.
Example:	AgentIII C1 S8 L1D>show vlan configvid:1fid:0priority:0priv_override:disableport1:noModport2:noModport3:noModvid:2fid:0priority:0priv_override:disableport1:notMemberport2:notMemberport3:notMemberAgentIII C1 S8 L1D>remove vlan vid 2AgentIII C1 S8 L1D>show vlan configpriv_override:disablevid:1fid:0priority:0priv_override:disableport1:noModport2:noModport3:AgentIII C1 S8 L1D>priority:0priv_override:disableport1:noModport2:noModport3:AgentIII C1 S8 L1D>priority:0priv_override:disable
Set VLAN Entry Tagging

Syntax:	set vlan vid= <xx> port=<yy> memetag={zz}</yy></xx>
Description:	Sets a port and VLAN tagging mode for the device. By default, VLAN ID one (VID 1) is defined for internal use.
	where:
	xx = ID (2–4094) of the VLAN to which the device is to become a member (VID).
	yy = the port number (1-2 for x3220 or 1-3 for x3221).
Example:	
C1 S3 L1D>se noMod notMember tag	t vlan vid=10 port=2 memetag ?
unTag	
C1 S3 L1D> se C1 S3 L1D>	t vlan vid=10 port=2 memetag=unTag

Set VLAN Entry Priority

Syntax:	set vlan vid= <xx> priority=<yy></yy></xx>
Description:	Sets a VLAN priority for the device. By default, VLAN ID one (VID 1) is defined for internal use.
	where:
	xx = ID (2-4094) of the VLAN (VID) to which the device is to become a member.
	yy = priority for frames; 0-7, where 7 is the highest priority.
Example:	C1 S3 L1D>set vlan vid=10 fid=10 priority=<0-7> C1 S3 L1D>

Set VLAN Entry Priority Override

Syntax:	set vlan vid= <xx> pri–override={zz}</xx>
Description	Sets the VLAN priority override for the device. By default, VLAN ID one (VID 1) is defined for internal use.
	where:
	xx = ID (2–4094) of the VLAN to which the device is to become a member
	yy = optional; priority for frames; 0-7, where 7 is the highest priority
	<pre>zz = optional: priority override: {enable disable}</pre>
Example:	C1 S3 L1D> set vlan vid= 10 fid= 10 pri-override =enable

Show VLAN Configuration

Syntax:	set vlan vid= <xx></xx>	[priority= <yy>]</yy>	[pri–override ={zz}]
---------	-------------------------	-------------------------------	------------------------------

Description: Displays the current VLAN configuration settings.

Example:	C1 S3 L1D>	show vlan conf	ig	
	vid:10	fid:0	priority: 2	<pre>priv_override:disable</pre>
	port1: S3240>	noMod port2:	Тад	

Flush VLAN FID

Syntax:	flush fiddb type= <all dynamic></all dynamic>
Description:	Device level command to clear the dynamic entries or all of the entries in the VLAN forwarding information database.
Example:	<pre>C1 S1 L1D>flush fiddb type ? all dynamic C1 S1 L1D>flush fiddb type dynamic Cannot flush vlandb on this card! C1 S1 L1D>go c=1 s=3 l1d C1 S3 L1D>flush fiddb type dynamic Flushing fiddb is in progess! Flush VLANdb succeeded! C1 S3 L1D>flush fiddb type all Flushing fiddb is in progess!</pre>

Flush VLAN DB

Syntax:	flush vlandb all
Description:	Device level command to erase all VLAN database entries except for the default VLAN database entry (which cannot be deleted). When the 'FIDDb Flush Operation' is 'Flush All FIDs' or Flush All Dynamic FIDs', the value (14094) specifies the FID to be flushed. A value of 0 means no FID is specified.
Example:	C1 S3 L1D> flush vlandb all Flushing VLANdb is in progress! Flush VLANdb succeeded! C1 S3 L1D>

Configure VLAN Mode (Secure/Disable/Fallback/Check)

The VLAN table specifies certain forwarding rules for packets that have a specific 802.1q tag. Those rules are of higher priority than switch groups configured using 'master-port' property. The table contains entries that map specific VLAN tag IDs to a group of one or more ports. Packets with VLAN tags leave the switch chip through one or more ports that are set in the corresponding table entry. The specific logic controlling how packets with VLAN tags are treated is controlled by a VLAN Mode parameter that is configurable per switch. This forwarding based on VLAN tag IDs also takes into account the MAC addresses learned or manually added in the host table.

The VLAN Mode parameters are described below.

• **Secure**: drop packets with VLAN tag that is not present in VLAN table. Packets with VLAN tags that are present in the VLAN table, but if an incoming port does not match any port in the VLAN table, then that entry gets dropped.

• **Disable**: ignore VLAN table, treat packet with VLAN tags just as if they did not contain a VLAN tag. **Note**: VLAN Mode = Disable and Frame Tag Mode - Customer must be set at the same time.

• **Fallback**: the default mode - handle packets with VLAN tag that is not present in vlan table just like packets without VLAN tag. Packets with VLAN tags that are present in VLAN table, but incoming port does not match any port in VLAN table entry does not get dropped.

• **Check**: drop packets with VLAN tag that is not present in VLAN table. Packets with VLAN tags that are present in VLAN table, but incoming port does not match any port in VLAN table entry does not get dropped. Packets without a VLAN tag are treated just as if they had a VLAN tag with a default port VLAN ID. This means that if VLAN Mode = Check or Secure is to be able to forward packets without VLAN tags, then you must add a special entry to the VLAN table with the same VLAN ID set according to the default VLAN ID.

2	set port dot1-state	
Description.	Configure a copper or fiber port	s ieee ouz.iq state.
Example:	Agent III C1 S2 L1P2>set port check fallback secure vlanDisabled vlanEnabled Agent III C1 S2 L1P2>set port Agent III C1 S2 L1P2>show por Dot1q state: Discard-tagged: Default VLAN id: Force use default VLAN id: Agent III C1 S2 L1P2>set port Agent III C1 S2 L1P2>set port Agent III C1 S2 L1P2>show por Dot1q state: Discard-tagged: Discard-tagged: Discard-tagged: Discard-tagged: Discard-tagged: Discard-untagged: Default VLAN id:	<pre>dot1-state check t vlan config check false false 1 false dot1-state fallback</pre>

Set Port VLAN Tag Mode

```
Force use default VLAN id:
                              false
Agent III C1|S2|L1P2>set port dot1-state secure
Agent III C1|S2|L1P2>show port vlan config
Dot1q state:
                              secure
Discard-tagged:
                              false
                              false
Discard-untagged:
Default VLAN id:
                              1
Force use default VLAN id:
                              false
Agent III C1|S2|L1P2>set port dot1-state vlanEnabled
Agent III C1|S2|L1P2>show port vlan config
Dot1q state:
                              secure
Discard-tagged:
                              false
Discard-untagged:
                              false
Default VLAN id:
                              1
Force use default VLAN id:
                              false
Agent III C1|S2|L1P2>set port dot1-state vlanDisabled
Agent III C1|S2|L1P2>show port vlan config
Dot1q state:
                              vlanDisabled
Discard-tagged:
                              false
Discard-untagged:
                              false
Default VLAN id:
                              1
Force use default VLAN id:
                              false
Agent III C1|S2|L1P2>
```

VLAN Port-Level Commands

Note: These commands can only be entered at the port level - when the last part of the command line prompt indicates the location is a port (e.g., C1|S3|L1P1>).

Set Port VLAN Tag Mode

- Syntax: set port vlan tag mode=<xx>
- *Description:* Sets the port's VLAN type.

where:

xx = Customer, Network, or Provider. If Provider is entered, you must also define the Provider ETH Type (see below).

Example:	C1 S3 L1P1>set customer network provider	port	vlan	tag	mode	?
	C1 S3 L1P1> set C1 S3 L1P1>	port	vlan	tag	mode=	network

Set Port VLAN Tag Provider Eth Type

Syntax: set port vlan tag provider ethtype=<xx>

Description: Sets the port's VLAN Provider ETH type. This command sets Ethernet tagging type when VLAN tagging mode is set to "Provider" on a port interface.

where:

xx = x8100, x88a8, or x9100. You only need to define the Provider ETH Type if Provider was selected via the **set port vlan tag mode** command (see above).

Example:	C1 S3 L1P1>set port vlan tag provider ethtype ?
	x8100
	x88a8
	x9100
	C1 S3 L1P1>set port vlan tag provider ethtype=x9100
	Current VLAN tagging mode is not 'provider'!
	C1 S3 L1P1>set port vlan tag mode=provider
	C1 S3 L1P1>set port vlan tag provider ethtype=x9100
	C1 S3 L1P1>

Note: If you enter this command with the current VLAN tagging mode not set to 'Provider', the message "*Current VLAN tagging mode is not 'provider'!*" displays.

Set Force Port to Use Default VID

 Syntax:
 set port force-default-vid={true | false}

 Description:
 If set =true, forces all untagged and 802.1Q tagged frames to use the default VLAN-ID.

 Example:
 C1|S3|L1P1>set port force-default-vid=true

 C1|S3|L1P1>

Use the **show port vlan config** command to display the current setting.

Set VLAN Port Default VID

Syntax: **set port default–vid=**<xx>

Description: Sets the default VLAN ID (VID) for this port. The factory default is 1.

where:

xx= VID: (2-4094)

Example: C1|S3|L1P1>set port default-vid=2 C1|S3|L1P1>go l1p=2 C1|S3|L1P2>set port default-vid=2 C1|S3|L1P2>

Use the **show port vlan config** command to display the current default VID.

Set VLAN Port Discard Tagged Non-Management Frames

Syntax: **set port discard–tagged**={true | false}

Description: Sets if tagged non-management frames are to be discarded for this port.

Example: C1|S3|L1P2>set port discard-tagged ?
 false
 true
C1|S3|L1P2>set port discard-tagged true
C1|S3|L1P2>set port discard-tagged false
C1|S3|L1P2>

Use the **show port vlan config** command to display the current VLAN Discard-tagged state.

Set VLAN Port Discard Untagged Non-Management Frames

 Syntax:
 set port discard-untagged={true | false}

 Description:
 Sets if untagged non-management frames are to be discarded for this port.

 Example:
 C1|S3|L1P2>set port discard-untagged ?

 false
 true

 C1|S3|L1P2>set port discard-untagged true

 C1|S3|L1P2>set port discard-untagged true

 C1|S3|L1P2>set port discard-untagged true

 C1|S3|L1P2>set port discard-untagged false

 C1|S3|L1P2>

Use the **show port vlan config** command to display the current VLAN Discard untagged state.

Show VLAN Port Configuration

Syntax:	show	port	vlan	config	
---------	------	------	------	--------	--

Description: Displays the VLAN configuration of a port.

Example:

C1|S3|L1P2>**show port vlan config** Dot1q state: vlanEnabled Discard-tagged: false Discard-untagged: false Default VLAN id: 22 Force use default VLAN id: false C1|S3|L1P2>

Show VLAN Port Tag Configuration

Syntax:	show port vlan tag config
Description:	Displays the VLAN tag configuration of a port.
Example 1:	C1 S3 L1P2>> show port vlan tag config Tagging mode: network Network tagging: addTag
Example 2:	C1 S3 L1P2> show port vlan tag config Tagging mode: customer
Example 3:	C1 S3 L1P2> show port vlan tag config Tagging mode: provider Provider Ethernet type: x88a8

VLAN Database Device-Level Commands

Note: These commands can only be entered at the device level -when the last part of the command line prompt indicates the location is a device (L1D, L2D or L3D).

Add VLAN Database Entry

Syntax:	add vlan-db vid= <xx> [priority=<yy>] [pri-override={zz}]</yy></xx>
Description:	Adds a new VLAN to the device. By default, VLAN ID one (VID 1) is defined for internal use.
	where:
	xx = ID (2–4094) of the VLAN to which the device is to become a member
	yy = optional; priority for frames; 0-7, where 7 is the highest priority
	zz = optional: priority override: {enable disable}
Example:	C1 S3 L1P1>add vlan-db vid=4 Error: this command should be executed on a device! C1 S3 L1P1>go l1d C1 S3 L1D>add vlan-db vid=4 C1 S3 L1D>

Remove All VLANs

Description: Removes all VLANs from the device.

Note: you can not remove VID 1 as this is used for internal purposes.

Example:	C1 S3 L1D>remove vlan ?
	all
	vid
	C1 S3 L1D> remove vlan all

Remove a Single VLAN Database Row Entry

Syntax: remove vlan-db vid=<xx>

Description: Removes the specified VLAN forwarding database VLAN ID (2-4094). Removes a specified row from VLAN forwarding database.

Example:	AgentIII C1 S8 L1D> add vlan-db vid 3 AgentIII C1 S8 L1D> show vlan-db config
	vid:1 fid:0 priority:0 priv override:disable
	port1: noMod port2: noMod port3: noMod
	vid:2 fid:0 priority:0 priv_override:disable
	port1: notMember port2: notMember port3: notMember
	vid:3 fid:0 priority:0 priv_override:disable
	port1: notMember port2: notMember port3: notMember
	AgentIII C1 S8 L1D>remove vlan-db vid 3
	AgentIII C1 S8 L1D> show vlan-db config
	vid:1 fid:0 priority:0 priv_override:disable
	port1: noMod port2: noMod port3: noMod
	vid:2 fid:0 priority:0 priv_override:disable
	port1: notMember port2: notMember port3: notMember
	AgentIII C1 S8 L1D>

Set VLAN Database Member/Egress Tagging

Syntax:	set vlan-db vid= <xx> port=<yy> memetag=<zz></zz></yy></xx>			
Description:	Sets the VLAN member egress tagging for a row of the VLAN forwarding databas			
	where:			
	 xx = number that identifies the VLAN (2–4094) yy = logical port index (1-10) (enter physical ports 1-2) 			
	 zz = valid memetag choices are: noMod (case sensitive) – a VLAN member with no modifications 			
	 notMember (case sensitive) – not a VLAN member tag (case sensitive) - a VLAN member with egress tagging unTag (case sensitive) – a VLAN member with no egress tagging 			
F				

Set VLAN Database Priority Override

Syntax: set vlan-db vid=<1-4094> fid=FID pri-override=(enable|disable)

Description: Sets the priority override of a row of the VLAN forwarding database.

where:

FID = Forwarding Information Database - the address of the database in the switch. The FID may be the same as the V-LAN ID (VID) or different, depending on the device.

Example: C1|S5|L1D>set vlan-db vid=22 fid=23 pri-override=enable C1|S5|L1D>set vlan-db vid=22 fid=23 pri-override=disable C1|S5|L1D>set vlan-db vid=22 fid=55 pri-override=enable C1|S5|L1D>set vlan-db vid=22 fid=55 pri-override=disable C1|S5|L1D>

Set VLAN Database Priority

Syntax: set vlan-db vid=<1-4094> fid=FID priority=<0-7>

Description: Sets the priority of a row of the VLAN forwarding database.

where:

FID = Forwarding Information Database - the address of the database in the switch. The FID may be the same as the V-LAN ID (VID) or different, depending on the device.

Example:C1|S5|L1D>set vlan-db vid=23 fid=56 priority=2C1|S5|L1D>set vlan-db vid=23 fid=55 priority=2C1|S5|L1D>set vlan-db vid=22 fid=23 priority=2C1|S5|L1D>set vlan-db vid=22 fid=23 priority=2C1|S5|L1D>set vlan-db vid=22 fid=56 priority=2C1|S5|L1D>set vlan-db vid=22 fid=56 priority=2C1|S5|L1D>

Show VLAN Database Configuration

Syntax: show vlan-db config

Description: Displays the VLAN database entries for a device.

Example 1:

vid:1	fid:0	priority:0	<pre>priv_override:disable</pre>	port1: noMod	port2: noMod
vid:100	fid:0	priority:0	<pre>priv_override:disable</pre>	port1: notMember	port2: notMember

Example2:

C1 S5 L1	D> show vl a	an-db config			
vid:1	fid:0	priority:0	priv_override:disable	port1: noMod	port2: noMod
vid:2	fid:0	priority:0	priv_override:disable	port1: notMember	port2: tag
vid:3	fid:0	priority:0	priv_override:disable	port1: tag	port2: notMember
vid:4	fid:0	priority:0	priv_override:disable	port1: notMember	port2: notMember
vid:100	fid:0	priority:0	priv_override:disable	port1: tag	port2: unTag
vid:200	fid:0	priority:0	priv_override:disable	port1: tag	port2: unTag
vid:222	fid:0	priority:0	priv_override:disable	port1: notMember	port2: notMember
vid:300	fid:0	priority:0	priv_override:disable	port1: tag	port2: ndMod
vid:600	fid:0	priority:0	priv_override:disable	port1: unTag	port2: tag
C1 S5 L1	D>				

Example 3:

CI CI I IDV	show vlan-do	mfia			
		Coning			
vid:1	fid:0	priority:0	priv_override:disable	port1: noMod	port2: ndMod
vid:200	fid:0	priority:0	priv_override:disable	port1: tag	port2: unTag
vid:600 C1 S3 L1D>	fid:0	priority:0	priv_override:disable	port1: unTag	port2: tag

Basic ION System Troubleshooting

This basic process is intended to provide some high-level techniques that have been found useful in isolating ION problems. This process is not a comprehensive guide to troubleshooting the ION system. The intent here is to 1) avoid missing any important information, 2) simplify analysis of captured information, and 3) improve accuracy in finding and explaining problem causes and solutions.

This basic process applies to these ION system and related components:

- ION Chassis
- ION NIDs (SICs, or slide-in-cards)
- IONMM
- ION software (ION System Web Interface or ION command line interface CLI).
- ION power supply
- ION Options (ION SFPs, ION LG Kit, etc.)
- Data cables, electrical cables, and electrical outlets
- Third party network equipment (circuit protection equipment, battery backup, 3rd party client or server software RADIUS or TFTP, etc.)

When troubleshooting an ION system / network problem on site:

- 1. Document the operation taking place when the failure occurred.
- 2. Capture as much information as possible surrounding the failure (the date and time, current configuration, the operation in process at the time the problem occurred, the step you were on in the process, etc.).
- 3. Start a log of your ideas and actions, and record where you were in the overall scheme of the system process (i.e., initial installation, initial configuration, operation, re-configuration, upgrading, enabling or disabling a major feature or function, etc.).
- 4. Write down the error indication (message, LED indicator, etc.). Take a screen capture if the problem displayed in software.
- 5. Start with the most simple and work towards the more complex possible problem causes (e.g., check the network cables and connections, check the device LEDs, verify the NIDs are seated properly, view the CLI **show** command output, check the Syslog file, verify IP addresses and Gateway IP address, check Windows Event Viewer, ping the interface, run the various tests if functional, etc.).
- 6. Write down your initial 2-3 guesses as to the cause of the problem.
- Verify that the TN product supports the function you are attempting to perform. Your particular TN product or firmware version may not support all the features documented for this module. For the latest feature information and caveats, see the release notes for your particular device/system and firmware release.
- 8. Use the Web interface or command line interface (CLI) to obtain all possible operating status information (log files, test results, **show** command outputs, counters, etc.)
- 9. If LOAM is configured, check the LOAM Event Log table parameters,. Print the output if possible.
- 10. Use the ION system manual procedure to retry the failed function or operation.
- 11. For the failed function or operation, verify that you entered valid parameters using the cursorover-help (COH) and/or the ION system manual.
- 12. Based on the symptoms recorded, work back through each step in the process or operation to recall a point at which the problem occurred, and examine for a possible failure point and fixe for each.

- 13. Document each suspected problem and attempted resolution; eliminate as many potential causes as possible.
- 14. Isolate on the 1-2 most likely root causes of what went wrong, and gain as much information as you can to prove the suspected cause(s).
- 15. If you find a sequence of actions that causes the problem to recur, replicate the full sequence several times and document it if possible.
- 16. Review your logged information and add any other comments that occur to you about what has taken place in terms of system behavior and suspected problem causes and solutions.
- 17. Review the "Recording Model Information and System Information" section on page 338 before calling for support.

Recording Model Information and System Information

After performing the troubleshooting procedures, and before calling or emailing Technical Support, please record as much information as possible in order to help the Technical Support Specialist.

 Select the ION system MAIN tab. (From the CLI, use the commands needed to gather the information requested below. This could include commands such as show card info, show slot info, show system information, show ether config, show ip-mgmt config, show loam config, or others as request by the Support Specialist.)

2. Record the Model Information for your system.

Serial Number:	Model:
Software Revision:	Hardware Revision:
Bootloader Revision:	

3. Record the **System Configuration** information for your system.

 System Up Time:
 Configuration Mode:

 Console Access:
 Device Description:

Number of Ports: ______ MAC Address: ______

4. Provide additional Model and System information to your Technical Support Specialist. See "Basic ION System Troubleshooting" on page 190.

Your Lantronix service contract number: _____

A description of the failure: _____

A description of any action(s) already taken to resolve the problem (e.g., changing switch mode, rebooting, etc.):

The serial and revision numbers of all involved Lantronix products in the network:

A description of your network environment (layout, cable type, etc.): _____

Network load and frame size at the time of trouble (if known): ______

The device history (i.e., have you returned the device before, is this a recurring problem, etc.):

Any previous Return Material Authorization (RMA) numbers: ______

Appendix A: CLI Command Summary

This appendix provides the list of available CLI commands via the help (?) command and the *list* command. Commands are arranged in alphabetical order. CLI commands are case sensitive; enter the CLI commands as shown. To execute these commands, press the **Enter** key after the command has been entered.

ION CLI Commands via the *help* Command (C1|S8|L1D>?)

Agent III C1|S7|L1D>? 1. add Add a ACL condition Backup specified provision modules. 2. backup Show the content of the FILES 3. cat 4. cd Change to another directory 5. clear Clear all counters of the specified Ethernet port 6. cls Clear the screen. 7. flush Flush VLAN db. 8. generate Generate the specified SSH host key. set location to device/port of the SIC to be operated. 9. go 10. home go back to IONMM card Print command list 11. list 12. ls List the information about the FILES A filter for paging through text one screenful at a time. 13. more 14. ping Send ICMP ECHO-REQUEST to network hosts. 15. ping6 Send ICMP ECHO-REOUEST to network hosts. 16. prov Get current TFTP server address. Report a snapshot of the current processes 17. ps 18. pwd Show current directory Exit current mode and down to previous mode 19. **quit** 20. reboot Warm start the system. 21. refresh Refresh backup and restore configure file name. 22. remove Remove all ACL conditions 23. reset Reset all ports' counters of the specified Ethernet port 24. restart Restart ACL Restore specified provision modules. 25. restore Initiates the delay measurement for a given MEP. Please note that only one DM request is supported at a time for a given MEP. 26. send 27. serial transfer file through a serial line. 28. set Set bakup/restore configuration file name for a specified provision module. 29. show Show ACL chains 30. start Start TDR test of the specified Ethernet port 31. stat Show topology information of a chassis. 32. tftp Get a file from a TFTP server. 33. update Update fireware database 34. **upgrade** Upgrade firmware modules Agent III C1|S7|L1D>

Note: The list numbers (above) are added for reference only. The list above is for Admin level users; the list below is displayed for users with Read-Only and Read-Write level privileges.

Help (?) command (Read-Only or Read-Write user levels):

Agent III C1|S1|L1D>?

- 1. cat Show the content of the FILES
- 2. cd Change to another directory
- 3. **cls** Clear the screen.
- 4. go set location to device/port of the SIC to be operated.
- 5. home go back to IONMM card
- 6. list Print command list
- 7. 1s List the information about the FILES
- 8. more A filter for paging through text one screenful at a time.
- 9. ping Send ICMP ECHO-REQUEST to network hosts.
- 10. ps Report a snapshot of the current processes
- 11. pwd Show current directory
- 12. quit Exit current mode and down to previous mode
- 13. set Set password for a system user
- 14. show Show ACL chains
- 15. stat Show topology information of a chassis.

Agent III C1|S1|L1D>

ION CLI Commands via the list Command (C1|S8|L1D>list)

CLI commands are case sensitive. Enter the CLI commands in lower case. To execute these commands, you must press the **Enter** key after the command has been entered. Not all commands listed here are functional on all NID models. For example, the "set tdm" and "show tdm" commands only function on the ION x61xx. See the ION System x6110/x6120 Managed 4xT1/E1-to-Fiber NID User Guide for x61xx commands.

Appendix B: Web Interface vs. CLI Commands

This appendix provides a cross-reference of the functions configurable via the Web interface versus CLI commands.

Web Field	CLI Command
MAIN tab	System Level Ops
System Name	set system name / show system info
System Contact	set system contact / show system info
System Location	set system location / show system info
Console access	set usb-port state / show usb-port state
Reset Uptime	reset system uptime
System Reboot	reboot
Reset to Factory Config	reset factory
All counters Reset	reset all ports counters
Device Description	set circuit id
L2CP Disposition	set ethernet port I2cp configuration show ethernet port I2cp configuration
Login Type	set login method
VLAN ID	set management vlan id
Status	set management vlan admin state
Member Ports	set management vlan Ports
Enable/disable SNMP access	set snmp status
SNMP version	set snmp version
Trap manager	set snmp trap host
none	set snmp read community set snmp write community
Server Address (Syslog)	set syslog svr type xxxx addr y.y.y.y
Server Port (Syslog)	set syslog svr port
Level (Syslog)	set syslog level
Mode (Syslog)	set syslog mode
TFTP Server Address	prov set tftp svr type=x addr=y

Web Field	CLI Command
Firmware File Name	tftp put iptype=x ipaddr=y localfile=z tftp get iptype=x ipaddr=y remotefile=z

IP tab	IP operations
IP v4 Address Mode	set ip address mode (Note : "set dhcp state" replaced by "set ip address mode" after ION v 1.2.0.)
IP Address, Subnet Mask	set ip address
Default Gateway	set gateway address
DNS servers	set dns server
IPv6 Status	set ipv6-mgmt state
IPv6 IP Address Mode	set ipv6 addr mode
IPv6 IP Address	
IPv6 Prefix Length	
IPv6 Gateway Mode	set ipv6 gateway mode

ADVANCED tab	Advanced operations
FDB Aging Time	set dot1bridge aging-time=x
MAC Address Learning	set mac enable portlist=x
Transparent LPT	set transparent lpt state=x
Selective LPT	set selective lpt state=x
Monitoring Port	set lpt monitor-port
IEEE Priority Class: Remap x to (PID)	set dot1dbridge ieee-tag-priority=x remap-priority=y
IP Traffic Class: Remap 0 to: (DSCP)	set dot1dbridge ip-priority-index=x remap-priority=y

SNTP tab	SNTP operations
SNTP Client	set sntp status
Device time	set current time
UTC timezone	set sntp timezone
daylight savings time	set sntp daylight savings time status
daylight saving period start	set daylight savings start time
daylight saving period end	set daylight savings end time
daylight saving offset	set daylight savings offset
SNTP server	set sntp server address

HTTPS tab	HTTPS operations
HTTPS Status	set https state
HTTPS port	set https port number
TFTP Server Address	prov set tftp svr type=x addr=y
Certificate file name	set https certificate file
Certificate Type	set https certificate type
private file name	set https private key file
private password	set https private key file password
Copy Certificate button	start https certificate operations

SSH tab	SSH operations
SSH Server Status	set ssh server state
SSH Auth Timeout	set ssh timeout
SSH Auth Retries	set ssh authentication retry
Host Key Type	set ssh public-key user=x type=y
Save host key to flash	none; reserved for future use
Generate button	generate ssh host key
Delete	remove ssh host-key remove ssh public-key
User Name	set ssh public-key user=x
Public Key Type	set ssh public-key user=x type=y

TFTP Server Address	prov get tftp svr addr=x prov set tftp svr type=x addr=y
Source File Name	set ssh public-key user=x type=y file=z
Copy Public Key button	none
Delete button	remove ssh host-key remove ssh public-key

RADIUS tab	RADIUS operations
RADIUS Client	set radius authentication
Server Address	set radius server
server secret	set radius server secret
Retries	set radius retry
Timeout	set radius timeout

TACACS+ tab	TACACS+ operations
TACACS+ Client	set tacplus client state
Server Address	set tacplus Server / type / address
Server Secret	set tacplus server / secret
Retries	set tacplus server / retry
Timeout	set tacplus server / timeout

ACL tab	ACL operations
ACL Status	set acl state
Chain Name	set acl chain default policy (chain= parameter)
Chain policy	set acl chain default policy (policy= parameter)
Rules: Priority	set acl
Rules: Policy	set acl
Rules: Traprate	set acl
Rules: Add	add acl
Rules: Delete	remove acl rule
Condition: Type	set acl condition=x rule_index=y
Condition: Source or Destination	add acl condition type=x srcdst=y oper=z value=w
Condition: Operation	add acl condition type=x srcdst=y oper=z value=w
Condition: Value	add acl condition type=x srcdst=y oper=z value=v in- dex=w
Condition: Add button	add acl condition type=x srcdst=y oper=z value=v in- dex=w
Condition: Delete button	remove acl condition
ACL Status: Enabled/Disabled	restart acl

FDB tab	FDB operations
MAC Address	add fwddb mac=xx-xx-xx-xx-xx
Port	add fwddb mac=x conn-port=y priority=z type=w
Priority	add fwddb mac=x conn-port=y priority=z type=w
Entry Type	add fwddb mac=x conn-port=y priority=z type=w
Add button Edit button Delete button	add fwddb set fwddb remove fwddb all/mac
Flush FDBs	flush fiddb type/all

VLAN tab	VLAN operations
VLAN ID	add vlan vid=x priority=y priority-override=z
Priority Override	set vlan vid=x priority=y priority-override=z
Priority	set vlan vid=x priority=y priority-override=z
Member Tag Port x	set vlan vid=x port=y memetag=z
Flush VLANs	flush vlandb all
Add button	add vlan vid=
Edit button	set vlan vid=x priority=y priority-override=z
Delete button	remove vlan=x

BACKUP-RESTORE tab (IONMM)	Backup - Restore operations
TFTP Server Address	none
Backup	none
Backup: Download button	tftp put
Restore	none
Restore: Upload button	tftp get

Upgrade tab (IONMM)	Upgrade operations
TFTP Server Address	prov get tftp svr addr=x prov set tftp svr type=x addr=y
Firmware File Name	tftp put iptype=x ipaddr=y localfile=z tftp get iptype=x ipaddr=y remotefile=z
Upload button	tftp upgrade
Upgrade (Targets)	none

LOAM Tab	LOAM operations
Admin Status	set usb-port state
LOAM Mode	set loam mode
Loopback Type	set ether loopback type
Ignore Loopback Request	Ignore loopback request
LOAM Peer Information field	get loam peer information
LOAM Peer Vendor OUI field	get loam peer vendor oui

USERS Tab

Web Field	CLI Command
User Name	set sysuser name=nn
Password	set sysuser name= nn pass=xx
Confirm Password	set sysuser name= nn pass=xx confirmpass=xx
Level	set sysuser name= nn level=xxx

SNMP Tab (IONMM)
Web Field	CLI Command					
SNMP General sub-tab						
Community String Access Mode	Add SNMP Community Name / Access Mode					
SNMP v3 Engine ID	Add SNMP Remote Engine Add SNMP Remote User Name / Engine Remove SNMP Remote Engine					
SNMP Users sub-tab						
User Name Group Name Security Model Security Level Authentication Protocol Authentication Password Privacy Protocol Privacy Password	Add SNMP Local User Remove SNMP Local User Set SNMP Local User Name Show SNMP Local User Add SNMP Group Remove SNMP Group Set SNMP Local User Group Show SNMP Group					
SNMP Groups sub-tab						
Group Name Security Model Security Level Read View Write View Notify View	Add SNMP Group Remove SNMP Group Set SNMP Group Name / Notify View Set SNMP Group Name / Read View Set SNMP Group Name / Write View Set SNMP Local User Group Show SNMP Group					
SNMP Views sub-tab						
View Name OID Subtrees Actions OID Subtree Type	Add SNMP View Name Remove SNMP View Set SNMP View Show SNMP View					
SNMP Trap Hosts sub-tab						
Trap Version IP Port Community / Security Name Security Level Authentication Protocol Authentication Password Privacy Protocol Privacy Password Engine ID	Add SNMP Traphost Remove SNMP Traphost Show SNMP Traphost					
SNMP Remote Users sub-tab						

Remote IP Remote Engine ID User Name Group Name Remote IP Security Model Security Level Authentication Protocol Authentication Password	Add SNMP Remote User Name / Address Type Add SNMP Remote User Name / Engine Remove SNMP Remote User Name / Address Type Remove SNMP Remote User Name / Engine ID Show SNMP Remote User
	Show SNMP Remote User

x222x/x32xx Port Level Fields / Commands

MAIN tab

Web Field	CLI Command			
MAIN tab	Main Port Level Ops			
Circuit ID	set circuit id, show circuit id			
Admin Status	set ether admin state			
Port Admin Mode	set port mgmtaccess			
Far End Fault Mode	set ether fef=			
Force Duplex	set duplex=x			
Pause Admin Mode	set ether pause set ether dot3 pause			
Port Forward Management – Forward Settings	set fwd portlist			
L2CP Disposition	set ethernet port I2cp configuration show ethernet port I2cp configuration			
Reset Counters	clear ether all counters			
TN Topology Discovery Protocol TX	set tndp tx state=x			

ADVANCED tab

Web Field	CLI Command			
ADVANCED tab	Advanced Port Level Ops			
Rate Limiting Mode	set irate=x erate=y			
Egress Rate Limit	set irate=x erate=y			
Ingress Rate Limit	set irate=x erate=y			
SA Lock	set ether src-addr-lock			
SA Lock Action	set ether src-addr-lock			
Filter Unknown Unicast	set ether filter-unknown-unicast			
Filter Unknown Multicast	filter-unknown-multicast			
Discard Tagged	set port discard-tagged			
Discard Untagged	set port discard-untagged			
Force Default VLAN	set ether force-default-vid			
Default VLAN ID	set port default-vid			
Default Priority	set qos default-priority=x			
IEEE Priority Class	set dot1dbridge ieee-tag-priority=x set dot1dbridge ip-priority-index=x			
IP Traffic Class	set qos priority tag-type=x			
Priority Precedence	set vlan vid=x fid=y priority=z set qos priority by-dst-mac set qos priority by-src-mac set qos priority by-vlan-id set qos priority ieee-tag set qos priority ip-tag set qos priority tag-type			
SA Priority Override	set qos priority by-src-mac			
DA Priority Override	set qos priority by-dst-mac			
VID Priority Override	set vlan vid=x fid=y pri-override=z			
Frame Tag Mode	set port vlan tag mode			

COUNTERS tab (Port Level)

Web Field	CLI Command		
COUNTERS tab	Port Level Counters Ops		
Reset Counters button	reset all ports counters		

LOAM tab (Port Level)

Web Field	CLI Command
LOAM tab	Port Level LOAM operations
<u>Main sub-tab</u> :	
Admin Status	show loam config show loam event config show loam event log show loam ignore-loopback-request show loam peer show loam statistics
LOAM Mode	set loam mode
LOAM Peer Information	show loam peer info
LOAM Vendor OUI	show loam peer info
Loopback Type	set loam loopback type
Ignore Loopback Request	set loam ignore (loopback request)

Counters sub-tab:	
Reset LOAM Counters button	reset all ports counters
Event Configuration sub-tab:	
Error Symbol Period Window High Bits Error Symbol Period Window Low Bits Error Symbol Period Threshold High Bits Error Symbol Period Threshold Low Bits Error Symbol Period Event Notification Error Frame Period Window Error Frame Period Threshold Error Frame Period Event Notification Error Frame Window Error Frame Threshold Error Frame Event Notification Error Frame Seconds Summary Window Error Frame Seconds Summary Threshold Error Frame Seconds Event Notification	set loam critical-evt-notif set loam dg-evt-notif set loam ef set loam ef-evt-notif set loam efp set loam efp-evt-notif set loam efss set loam efss-evt-notif set loam esp set loam esp
Dying Gasp	set loam dg-evt-notif
Critical Event	set loam critical-evt-notif

DMI tab

Web Field	CLI Command			
DMI tab (Port 2 only)	Port Level DMI Ops			
Rx Power Intrusion Threshold (µW)	set power relay state			
IONPS-A or IONPS-D chassis device: Temperature Sensor tab Voltage Sensor tab Power Sensor tab Fan tab	set sensor stid x notif set sensor stid x relation set sensor stid x severity set sensor stid x value			

Remote Device Level

Web Field	CLI Command			
BACKUP-RESTORE tab (IONMM)	Backup - Restore operations			
TFTP Server Address	tftp put iptype=x ipaddr=y localfile=z tftp get iptype=x ipaddr=y remotefile=z			
Backup	set backup			
Backup: Download button	tftp put			
Restore	restore			
Restore: Upload button	tftp get			
UPGRADE tab (IONMM)	Upgrade operations			
TFTP Server Address	prov set tftp svr type=x addr=y			
Firmware File Name	update firmware-db file=x			
Upload button	upgrade module			
Upgrade (Targets)	none			

Remote Device Port Level

Web Field	CLI Command			
MAIN tab	Port Level MAIN Ops			
AutoCross Mode	set ether autocross=x			
Auto Negotiation	set ether autoneg state=x			
Capabilities Advertised	set ether adv-cap=x			
Force Speed	set ether speed=x			
Force Duplex	set ether duplex=x			

Appendix C: CLI Messages and Recovery

The following messages may display during CLI operations.

Add ACL rule failed.

This message indicates that the rule could not be added.

- 1. Verify the CLI command syntax.
- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

Ambiguous command

A. This message indicates either a) the input for one of the parameters is incorrect, or b) a hyphen is missing between two parts of the command.

- 1. Verify the CLI command syntax.
- 2. Retry the operation.

B. You typed part of a valid CLI command and pressed **Enter** before completing the command syntax. For example, if you type

C1|S7|L1D>add v

and then press the **Enter** key, the message "% Ambiguous command." displays.

- 1. Type the part of the command that failed (**add v** in the example above), type a question mark (?), and the press **Enter**. The valid commands that start with the part of the command you initially entered are displayed.
- 2. Verify the CLI command syntax.
- 3. Retry the operation.

C. The system was unable to resolve the desired command based on the portion of the command entered. For example, you entered the following: C1|S7|L1D>set dot1

- 1. Verify the command syntax.
- 2. Retry the CLI command syntax. See Appendix A.
- 3. If the problem persists, contact Technical Support.

Bad advertisement capability!

This message indicates that the capabilities specified for the Set Ethernet Port Advertisement Capability command are not valid choices. For example:

C1|S5|L1P2>**set ether adv-cap 1000TFD** Bad advertisement capability!

- 1. Verify the command syntax.
- 2. Retry the operation. For a complete list of the available commands, see Appendix A.
- 3. If the problem persists, contact Technical Support.

Cannot get link pass through information on this card

This message indicates that a link pass through (LPT) CLI command was entered for an IONMM. CLI commands for LPT operations are only valid for slide-in modules other than the IONMM.

 Use the go command to change from the IONMM to the specific slide-in module. The go command format is: go [c=CHASSIS] [s=SLOT] [I1ap=PORT] [I2ap=PORT] (I1p=PORT|I2p=PORT|I3p=PORT|I1d|I2d|I3d)

go [c=<1-16>] [s=<1-32>] [l1ap=<1-15>] [l2ap=<1-15>] (l1p=<1-5>|l2p=<1-15>|l3p=<1-15>|l1d|l2d|l3d)

- 2. Retry the operation. For a complete list of the available commands, see the ION System CLI Reference Manual, 33473.
- 3. If the problem persists, contact Technical Support.

Cannot get LOAM configuration on this port! Cannot get LOAM event log on this port! Cannot get LOAM peer information on this port!

This message indicates that a port level command was entered for the IONMM but the command is only valid for the other types of slide-in modules.

1. Use the **go** command to change location of where the command operates. The **go** command format is:

go [c=CHASSIS] [s=SLOT] [l1ap=PORT] [l2ap=PORT] (l1p=PORT|l2p=PORT|l3p=PORT|l1d|l2d|l3d) go [c=<1-16>] [s=<1-32>] [l1ap=<1-15>] [l2ap=<1-15>] (l1p=<1-5>|l2p=<1-15>|l3p=<1-15>|l1d|l2d|l3d)

- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

Cannot get port security on this port!

This message indicates that a port level command was entered for the IONMM but the command is only valid for the other types of slide-in modules.

1. Use the **go** command to change location of where the command operates. The **go** command format is:

go [c=<1-16>] [s=<1-32>] [l1ap=<1-15>] [l2ap=<1-15>] (l1p=<1-5>|l2p=<1-15>|l3p=<1-15>|l1d|l2d|l3d)

- 2. Retry the operation. For a complete list of the available commands, see the ION System CLI Reference Manual, 33473.
- 3. If the problem persists, contact Technical Support.

Command incomplete

This message indicates that not all of the required fields were entered for the CLI command.

- 1. Verify the command syntax.
- 2. Retry the operation. For a complete list of the available commands, see the ION System CLI Reference Manual, 33473.
- 3. If the problem persists, contact Technical Support.

Could not open connection to the host on port 23. Connection failed.

This message indicates that the Telnet server and client are configured for different ports. For Telnet operations the default port is 23.

- 1. Ensure that the Telnet port is set to 23 for both the server and the client. This will require someone with administrative rights in order to make a change.
- 2. Add the port number to the Telnet command. Example:

Telnet <ipaddr> <port#>

3. If the problem persists, contact Technical Support.

Error: this command should be executed on a device

This message indicates that the CLI command was entered for a port and it is only applicable for a device.

1. Use the **go** command to change location of where the command operates. The **go** command format is:

go [c=<1-16>] [s=<1-32>] [l1ap=<1-15>] [l2ap=<1-15>] (l1p=<1-5>|l2p=<1-15>|l3p=<1-15>|l1d||2d||3d)

- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

Error: this command should be executed on a port

This message indicates that the CLI command was entered for a card and it is only applicable for a port.

1. Use the **go** command to change location of where the command operates. The **go** command format is:

```
go [c=<1-16>] [s=<1-32>] [l1ap=<1-15>] [l2ap=<1-15>] (l1p=<1-5>|l2p=<1-15>|l3p=<1-15>|l1d|l2d|l3d)
```

- 2. Retry the operation.
- 3. For a complete list of the available commands, see Appendix A.
- 4. If the problem persists, contact Technical Support.

Fail to get MAC address!

This message indicates that communications to the module can not be established.

- 1. Verify that the correct hierarchy has been specified in the command (see "Managing Slide-In and Remote Modules Using CLI Commands" on page 49).
- 2. For all modules (slide-in and remote) check the following:
 - module is properly seated/connected
 - module is powered up
- 3. Wait 60 seconds, then retry the operation.
- 4. Cycle power for the module in question. **Note:** for slide-in modules pull the module out so it is no longer connected to the backplane, then slide the module back in, ensuring that it is firmly seated.
- 5. Retry the operation.
- 6. If the problem persists, contact Technical Support.

Fail to get port type!

This message indicates that a port level command was entered for the IONMM but the command is only valid for the other types of slide-in modules.

- 1. Use the **go** command to change location of where the command operates.
- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

Incomplete location command!

This message indicates that one or more parameters for the **go** command are missing. The go command was entered to set location parameters, but the module, slot and/or port value(s) were no included in the command string.

The go command can operate on a local or remote card/port, and you must give the last parameter to specify the target is a port or device. For example, the input go c=1 s=14 does not include the port parameter, so the CLI module displays "Incomplete location parameters".

- 1. Verify the command syntax.
- 2. Re-enter the **go** command and be sure to include all of the location parameters:

```
go [c=<1-16>] [s=<1-32>] [l1ap=<1-15>] [l2ap=<1-15>] (l1p=<1-5>|l2p=<1-15>|l3p=<1-15>|l1d|l2d|l3d)
```

3. If the problem persists, contact Technical Support.

Invalid ACL condition index!

This message indicates that you tried to associate an ACL condition with an ACL rule but the condition does not exist.

1. Check what conditions exist; type:

show acl condition

- 2. Associate the correct condition with the correct rule, or create the condition if it does not exist.
- 3. If the problem persists, contact Technical Support. .

Invalid ACL rule index!

This message indicates that you tried to associate an ACL condition with an ACL rule that does not exist.

1. Check what rules exist; type:

show acl rule

- 2. Associate the correct condition with the correct rule, or create the rule if it does not exist.
- 3. If the problem persists, contact Technical Support.

Invalid condition value: xxxx

This message indicates that the input for the value= parameter on the **add acl condition** command in not valid.

- 1. Verify the value being input; it must match with the value input for type=.
- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

Invalid location parameters, cannot find the physical entity!

This message indicates that the system cannot detect the presence of the device or port specified in the **go** command.

- 1. Verify that the correct hierarchy has been specified in the command (see "Managing Slide-In and Remote Modules Using CLI Commands" on page 49).
- 2. For all modules (slide-in and remote) check the following:
 - module is properly seated/connected
 - module is powered up
- 3. Wait 60 seconds then retry the operation.
- 4. Cycle power for the module in question. **Note:** for slide-in modules pull the module out so it is no longer connected to the backplane, then slide the module back in, ensuring that it is firmly seated.
- 5. Retry the operation.
- 6. If the problem persists, contact Technical Support.

Invalid user!

This message indicates that the specified user is not valid.

- 1. Verify the user.
- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

Login incorrect

This message indicates that either the login or password entered while trying to establish a USB or Telnet connection is incorrect.

1. Verify the login/password.

Note: the login and password are case sensitive. The default login is **ION** and the default password is **private**.

- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

No DMI support on this port!

This message indicates that you entered a DMI command for a port that does not support DMI.

- 1. Verify that the port supports DMI.
- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

Now the value of table can only be "filter"!

You entered an unsupported ACL table or chain parameter value. For example:

- C1|S7|L1D>set acl table {raw|nat|mangle}
- C1|S7|L1D>set acl table raw chain prerouting|input|forward|output|postrouting}
- C1|S7|L1D>set acl table nat chain {prerouting|input|forward|output|postrouting}
- C1|S7|L1D>set acl table mangle chain {prerouting|forward|output|postrouting}
- 1. Enter the parameters table=filter and chain=input.
- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

There is no matched command

This message indicates that there is no such command available on this system.

- 1. Verify the command syntax.
- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

Unable to open xx. Please check your port settings.

This message indicates that HyperTerminal no longer recognizes which COM port to use for its connection.

- 1. Check that the USB cable is connected to the management station and the IONMM.
- 2. Check that the COM port is listed for the device manager on the management station (PC).
 - a) On the desktop, right-click on **My Computer**.
 - b) Select Manage.
 - c) Click Device Manager.
 - d) In the right panel, expand the list for COM & LPT.
- 3. Is the COM port in the list?

Yes	Νο				
Continue with step 4.	Restart the management station.				

- 4. In the HyperTerminal window, select **File>Properties**.
- 5. Check that the correct port is listed in the **Connect using** field.

- 6. Restart the management station.
- 7. Reboot the IONMM.
- 8. If the problem persists, contact Technical Support.

Error, you should first give full location parameters

The location value is incomplete; it is missing the module, slot and/or port value(s). This message can display when a device-level command is entered (e.g., **show lpt config**).

When you change a bigger container, the value of smaller object is cleared. For example, originally the operated object is Chassis=1, slot=4, L1AP=1 L2AP=2 L3D, and then when the command chassis 3 is entered. This automatically sets the value of module, slot and port to 0.

If the value of module, slot and port are not set in later commands, and then you run a device-level command (e.g., **show lpt config**), this error message displays.

Enter the **go** command and be sure to include all of the location parameters.

gp[c=CH4555][s=SLOT][l1ap=L0APORT][l2ap=L1APORT](l1p=PORT|l2p=PORT|l3p=PORT|l1d|l2d|Bd)

- 1. Wait for a few minutes for the message to clear.
- 2. Cycle power to the IONMM.
- 3. Retry the operation.
- 4. If the problem persists, contact Technical Support.

Start HTTPS certificate failed.

- 1. Verify the HTTPS parameters (HTTPS is enabled, the certificate type is defined, certificate file defined, private key file defined, password defined).
- 2. Verify that the HTTPS server is operational.
- 3. Retry the operation (i.e., type start https certificate and press Enter).
- 4. If the problem persists, contact Technical Support.

This command is only available on <x323x> card!

The command you entered is not supported on the card from which it was entered (e.g., you entered **set soam ma**, **set soam meg**, or **set soam mep** from a x222x or x32xx card, which does not support SOAM).

- 1. Verify the command entered is the one you want.
- 2. Verify that the device for the command entered can support the function of the command (e.g., functions / commands are supported by NID models x222x / x32xx NIDs).
- 3. Retry the operation.
- 4. If the problem persists, contact Technical Support.

Error: this command should be executed on a port!

- 1. Verify the command entered is the one you want.
- 2. Change to the desired port; enter the **go** command with all of the location parameters (chassis / slot / port).
- 3. Retry the operation from the port (i.e., type **show fwd portlist** and press **Enter**).

Unknown command!

The command you entered is not supported, or you entered the wrong command format / syntax.

- 1. Verify the CLI command syntax.
- 2. Retry the operation.
- 3. For a complete list of the available commands, see Appendix A.
- 4. If the problem persists, contact Technical Support.

There is no matched command.

The command you entered is not supported, or you entered the wrong command format / syntax.

- 1. Verify the CLI command syntax.
- 2. Retry the operation.
- 3. For a complete list of the available commands, see Appendix A.

4. If the problem persists, contact Technical Support.

Error location parameter number! Error: parameter out of range, chassis-id range is (0 .. 15)!) Error: parameter out of range, slot-id range is (1 .. 32) Error: parameter out of range, slot-id range is (0 .. 32) Incomplete location command!

The go command you entered had an invalid or missing parameter.

 Enter the go command with all of the location parameters (chassis / slot / port) in the format: go [c=<1-16>] [s=<1-32>] [l1ap=<1-15>] [l2ap=<1-15>] (l1p=<1-5>|l2p=<1-15>|l3p=<1-15>|l1d|l2d|l3d) for a slide in card, or go [c=<0-16>] [s=<0-32>] [l1ap=<1-15>] [l2ap=<1-15>] (l1p=<1-5>|l2p=<1-15>|l3p=<1-15>|l1d|l2d|l3d)

Fail to set link pass through state!

for a standalone card.

You tried to set the LPT state to an unacceptable state. For example, you typed:

C1|S3|L1D>set lpt state=enable

- 1. Verify the CLI command syntax.
- 2. Check the set lpt monitor-port and set selective lpt state command settings.
- 3. Enter the **show lpt config** command and in the Link Pass Through configuration, check if the Link pass through state is set to **notSupported** or if the **Remote fault detect state** is set to **notSupported**.

If either is set to **notSupported**, change the setting to enable (e.g., type **set rfd state enable** and press **Enter**).

- 4. Retry the operation.
- 5. If the problem persists, contact Technical Support. .

Invalid dot1dbridge MAC address!

You tried to add a fwddb (Forwarding Database) with an unacceptable address. For example, you typed:

C1|S3|L1D>add fwddb mac 11

and then pressed Enter.

- 1. Verify the CLI command syntax. See "Forwarding Database Commands" on page 76.
- 2. Retry the operation with a valid MAC address.
- 3. If the problem persists, contact Technical Support.

Invalid erate! Invalid irate!

You tried to set the Ingress or Egress rate to an unacceptable limit. For example, you typed:

C1|S3|L1D> C1|S7|L1D>set irate=100m erate=100m

and then pressed Enter.

- 1. Verify the CLI command syntax.
- 2. Retry the operation. See the "Set Bandwidth Rate Limit" command on page 53.
- 3. If the problem persists, contact Technical Support.

TFTP transfer failed!

The attempted firmware upgrade via the **tftp upgrade** command was unsuccessful.

- 1. Verify the CLI command syntax.
- 2. Verify the firmware version.
- 3. Be sure the TFTP server is configured and running.
- 4. Check that the remotefile is in the proper location (e.g., the file *x32xx.bin.0.5.4* is at *C*:*TFTP-Root*).
- 5. Retry the operation. See the **tftp upgrade** command.
- 6. If the problem persists, contact Technical Support.

Fail to transfer the file!

tftp get: set address type failed.

tftp put failed.

The file transfer attempt failed. The command you entered to do a tftp file transfer was unsuccessful (e.g., **tftp get** or **tftp put** or **tftp transfer**). For example:

C1|S4|L1D>**tftp get iptype ipv4 ipaddr 192.168.1.30 remotefile xxxx** tftp get: set address type failed. C1|S4|L1D>**tftp put iptype ipv4 ipaddr 192.168.1.30 localfile xxxx** tftp put failed. C1|S4|L1D>**tftp upgrade iptype ipv4 ipaddr 192.168.1.30 remotefile xxxx** tftp get: set address type failed.

- 1. Check the command syntax. See "TFTP Commands" page on page 157.
- 2. Make sure the TFTP server is configured and running.
- 3. Verify the filename to be transferred, its location, and the IP address of the TFTP server.
- 4. If the problem persists, contact Technical Support. US/Canada: 1-800-260-1312, International: + 1 952-358-3601.

Cannot set remote fault detect state on this card!

The attempted set rfd state command was rejected (e.g., C1|S7|L1D>set rfd state enable).

- 1. Verify that the card you entered the command on supports this function. See "Set RFD State" on page 190.
- 2. Retry the operation. See the **dot1bridge aging-time** command.
- 3. If the problem persists, contact Technical Support.

Cannot set service vid for tag on this card!

The attempted **set dot1bridge vid** command was rejected (e.g., C1|S7|L1D>set dot1bridge vid 2).

- 1. Verify that the card you entered the command on supports this function.
- 2. Retry the operation. See the **dot1bridge aging-time** command.
- 3. If the problem persists, contact Technical Support.

Fail to set aging time!

The attempted **set dot1bridge aging-time** command was not able to complete.

- 1. Verify the **dot1bridge aging-time** command syntax. See "Configure Forwarding Learning Aging Time" on page 191.
- 2. Retry the operation. See the **dot1bridge aging-time** command.
- 3. If the problem persists, contact Technical Support.

Get aging time failed!

The attempted show dot1bridge aging-time command failed to complete.

- 1. Verify the **dot1bridge aging-time** command syntax. See "Configure Forwarding Learning Aging Time" on page 191.
- 2. Retry the operation. See the **dot1bridge aging-time** command
- 3. If the problem persists, contact Technical Support.

Redundancy is not supported on this card!

The attempt to set or show fiber redundancy failed. For example, you entered the command: **show redundancy info**, but the device does not support fiber redundancy.

- 1. Verify that the card you entered the command on supports this function (must have at least 2 fiber ports) .
- 2. Retry the operation on a card that supports this function. See the "Fiber Redundancy Commands" section on page 104.
- 3. If the problem persists, contact Technical Support.

Invalid user!

You entered the command **show ssh public-key user admin**, but specified the wrong user (e.g., you typed **admin** instead of **root**).

- 1. Retry the operation using the correct user information. See "Show SSH Public Key of a User" on page 156.
- 2. If the problem persists, contact Technical Support.

Fail to set SSH server state!

You entered the command **set ssh server state=enable**, but have not generated an ssh host key.

- 1. Use the **get** command to obtain the key file. See the "TFTP Commands" on page 157.
- 2. Use the set ssh public-key user command to set the public key to a user from a key file.
- 3. Try the set ssh server state=enable command again. See "SSH Commands" commands on page 152.
- 4. If the problem persists, contact Technical Support. US/Canada: 1-800-260-1312, International: + 1 952-358-3601.

Fail to set management VLAN id! Fail to set management VLAN state!

You entered the command **set mgmt vlan state** or **set mgmt vlan port** or **set mgmt vlan vid** to enable or configure Management VLAN, but the operation failed.

- 1. Verify the VLAN Management configuration using the **show vlan** command and the **show vlan service** command.
- 2. Review the set mgmt vlan command syntax for the port / state / vid. See the "VLAN Commands" on page 119.
- 3. If the problem persists, contact Technical Support.

Upgrade is only supported on IONMM card!

You entered a firmware *upgrade* or firmware *update* command from a device other than the IONMM. For example:

```
C1|S3|L1D>show firmware upgrade result
C1|S3|L1D>show firmware-db update result
C1|S3|L1D>show upgrade firmware file
C1|S3|L1D>update firmware-db file cert
C1|S3|L1D>upgrade module
```

- 1. Make sure of the command you want to enter. See "Firmware Upgrade Commands" on page 137.
- 2. Use the **home** command to go to the IONMM device.
- 3. Re-enter the firmware upgrade command from the IONMM.
- 4. If the problem persists, contact Technical Support.

Cannot set bandwidth alloc type on this card!

You entered the command **set bw alloc-type countAllLayerx** on a card that does not support it. For example:

C1|S7|L1P1>**set bw alloc-type countAllLayer2** Cannot set bandwidth alloc type on this card!

- 1. Verify if the card supports bandwidth allocation.
- 2. Use the **go** command to switch to a different card and switch to the port level.
- 3. Verify the command entry. See "Bandwidth Commands" on page 53.
- 4. If the problem persists, contact Technical Support.

Cannot set ingress and egress rate on this card!

You entered the command **set irate=xx erate=xx** on a card that does not support it. For example:

C1|S7|L1P1>**set irate unLimit erate noLimit** Cannot set ingress and egress rate on this card!

- 1. Verify if the card supports rate limiting.
- 2. Use the **go** command to switch to a different card and switch to the port level.
- 3. Verify the command entry. See "Bandwidth Commands" on page 43.
- 4. If the problem persists, contact Technical Support.

DMI is only supported on FIBER port!

You entered the command **show dmi info** on a card that does not support it. For example:

C1|S7|L1P1>**show dmi info** DMI is only supported on FIBER port!

- 1. Verify if the card supports DMI.
- 2. Use the **go** command to switch to a different card port supporting Fiber.
- 3. Verify the command entry. See "DMI Commands" on page 55.
- 4. If the problem persists, contact Technical Support.

Link OAM is not supported on this card!

You entered the command **show loam rx loopback control** on a card that does not support it. For example:

C1|S7|L1P1>**show loam rx loopback control** Link OAM is not supported on this card!

- 1. Verify if the card supports loopback.
- 2. Use the go command to switch to a different card port supporting loopback.
- 3. Verify the command entry. See "LOAM Commands" on page 58.
- 4. If the problem persists, contact Technical Support.

Cannot clear loopback counters on this card! Cannot set administrate state on this port! Cannot set advertisement capability on this port! Cannot set autocross on this card! Cannot set auto negotiation state on this port! Cannot set Ethernet port speed for this card! Cannot set Ether port duplex mode on this card! Cannot set far end fault on this card! Cannot set filter unknown dest multicast frames on this port! Cannot set filter unknown dest unicast frames on this port! Cannot set pause on this port! Cannot set source address lock action on this port! No Time-domain reflectometer support on this card! Cannot get port security configuration on this port! Fail to get MAC control frames statistics! Cannot show forwarding port list on this card! Cannot show slot info on this card! Cannot show USB port state on this card! Cannot show TP port cable length on this card! Fail to get MAC control frames statistics! Fail to get auto-negotiation state! Fail to get port redundancy state! Fail to set dot3 pause

You entered a command (e.g., **clear ether all counters**) for a function not supported on the card. For example:

C1|S7|L1P1>clear ether all counters Cannot clear loopback counters on this card!

- 1. Verify if the card supports the desired function. See Table 3 in the section "Ethernet Port Commands" on page 64.
- 2. Use the **go** command to switch to a different card port supporting loopback.
- Verify the command entry. The command functions include 1) admin, 2) adv-cap, 3) autocross,
 4) autoneg, 5) duplex, 6) fef, 7) filter-unknown-multicast, 8) filter-unknown-unicast, 9) loopback,
 10) pause, 11) speed, and 12) src-addr-lock, 13) tdr, 14) ether security config, 15) fwddb, etc.

Cannot show port QoS configuration in this card! Cannot show port QoS priority remapping in this card! Cannot set tag type for priority in this card! Cannot set default priority in this card! Cannot set IEEE tag for priority in this card!

You entered a QOS command for a function not supported on the card. For example:

C1|S7|L1P1>**show qos config** Cannot show port QoS configuration in this card!

C1|S7|L1P1>**show qos priority remapping** Cannot show port QoS priority remapping in this card!

- 1. Verify if the card supports the desired function.
- 2. Use the **go** command to switch to a different card port supporting loopback.
- 3. Verify the command entry. See "QoS Commands" on page 98.

Cannot get VLAN database configuration on this card!

You entered a VLAN command for a function not supported on the card. For example:

C1|S7|L1D>show vlan Cannot get VLAN database configuration on this card! C1|S7|L1D>show vlan service Cannot show VLAN service configuration on this card!

- 1. Verify if the card supports the desired function.
- 2. Use the **go** command to switch to a different card port supporting VLAN.
- 3. Verify the command entry. See "VLAN Commands" on page 160.

Please input a number to specify threshold!

You entered a number to specify the errored frame (ef) threshold, but the number was not accepted. For example:

Please input a number to specify threshold! C1|S16|L1P1>set loam of threshold 100099

- 1. Enter the command set loam ef threshold= with a threshold number from 0-999999.
- 2. See the set loam ef threshold command for details.
- 3. If the problem persists, contact Technical Support.

The specified ACL rule index does not exist!

You tried to set an ACL Rule ID and traprate, but did not first create the associated rule. For example:

```
C1|S16|L1D>set acl rule 1 traprate 4444
The specified ACL rule index does not exist!
```

- 1. Make sure ACL operations are enabled; see the set acl state command on page 48.
- 2. Create an ACL rule. See "Add a New ACL Rule" on page 48.
- 3. Try entering the set acl rule command again.
- 4. If the problem persists, contact Technical Support.

Current VLAN tagging mode is not 'provider'!

You tried to set the port vlan tag type, but the current tag mode doesn't match. For example:

C1|S16|L1P2>**set port vlan tag provider ethtype=x8100** Current VLAN tagging mode is not 'provider'!

- 1. Set the VLAN tag mode to the desired mode using the set port vlan tag mode command.
- 2. If the problem persists, contact Technical Support. US/Canada: 1-800-260-1312, International: + 1 952-358-3601.

Cannot set VLAN network tagging on this port!

You tried to set the port's VLAN tag type, but the device does not support it. For example:

C1|S16|L1P2>**set port vlan tag network tagging addTag** Cannot set VLAN network tagging on this port!

- 1. Make sure this is the command / function that you wanted.
- 2. Use the go command to switch to a device that supports VLAN tagging.
- 3. Try entering the set port vlan tag command again.
- 4. If the problem persists, contact Technical Support.

Cannot show system information on this card!

You entered the **show system information** command from an unsupported device. For example:

C1|S22|L1D>**show system information** Cannot show system information on this card!

- 1. Use the **go** command to switch to a different device (e.g., from the Power Supply to the IONMM or an x222x/32xx card).
- 2. Try entering the **show system information g** command again.
- 3. If the problem persists, contact Technical Support.

Getting remapping priority fail

You entered a **show dot1dbridge** command but the command failed to execute. For example:

```
C1|S10|L1D>show dot1dbridge ieee-tag priority remapping
IEEE priority-index remapping-priority
Getting remapping priority fail
```

- 1. Verify the command syntax.
- 2. Use the **set dot1dbridge** command to set the remapping priority. See the "Dot1dbridge Commands" on page 64.
- 3. If the problem persists, contact Technical Support.

Set IEEE tag priority remapping failed!

You entered a **set dot1dbridge** command but the command failed to execute. For example:

```
C1|S10|L1D>set dot1dbridge ieee-tag-priority 0 remap-priority 1
Set IEEE tag priority remapping failed!
```

- 1. Verify the command syntax.
- 2. Use the **show dot1dbridge** command to display the remapping priority setting. See the "Dot1dbridge Commands" on page 64.
- 3. Try the **set dot1dbridge** command again.
- 4. If the problem persists, contact Technical Support.

Set IP traffic class priority remapping failed!

You entered a set dot1dbridge command but the command failed to execute. For example:

```
C1|S10|L1D>set dot1dbridge ip-priority-index 2 remap-priority 1
Set IP traffic class priority remapping failed!
```

- 1. Verify the command syntax.
- 2. Use the **show dot1dbridge** command to display the remapping priority setting. See the "Dot1dbridge Commands" on page 64.
- 3. Try the set dot1dbridge command again.
- 4. If the problem persists, contact Technical Support.

No such file or directory

You entered a cat or is command, but the parameters you specified could not be found. For example:

```
C1|S16|L1P1>1s 1 2
ls: 1: No such file or directory
ls: 2: No such file or directory
C1|S16|L1P1>
```

or

```
C1|S16|L1P1>cat 1 2
cat: 1: No such file or directory
cat: 2: No such file or directory
2C1|S16|L1P1>
```

- 1. Verify the [OPTION] and [FILE] parameters are entered accurately.
- 2. Review the cat or ls command section of this manual.
- 3. Try entering the cat or ls command again.
- 4. If the problem persists, contact Technical Support.

Cannot set slot power on this card!

You entered a set slot power= command on a device that does not support it. For example:

C1|S16|L1P1>**set slot 16 power on** Cannot set slot power on this card!

- 1. Verify this is the command you want.
- 2. Verify the command parameter; make sure you are not trying to power up a slot that already has power.
- 3. Use the **go** command to switch to the slot you want.
- 4. If the problem persists, contact Technical Support.

Error: this command should be executed on a power sensor or fan!

You entered a set sensor command on a device that does not support it. For example:

C1|S16|L1P1>**set sensor stid 1 notif true** Error: this command should be executed on a power sensor or fan!

- 1. Verify this is the command you want.
- 2. Use the **stat** command to show the chassis configuration. For example:
 - [22] IONPS-A Temperature Sensor Voltage Sensor Power Sensor Fan-1 Fan-2
- 3. Use the **go** command to switch to the power sensor or fan.
- 4. If the problem persists, contact Technical Support.

Invalid forward port list!

You entered an invalid parameter in response to a prompt (e.g., for a module number for firmware upgrade). For example:

C1 S7 L1D> upgrade module Available modules:		
index	module	loc
1 2 3 4 5 6 7	ION219 C3230-1040 C3230-1040 S3230-1040 IONMM C3231-1040 C2220-1014	c=1 s=0 l1d c=1 s=3 l1d c=1 s=5 l1d c=1 s=5 l1ap=2 l2d c=1 s=7 l1d c=1 s=10 l1d c=1 s=16 l1d
8	C3220-1040	c=1 s=18 l1d
9 Choose th	IONPS-A	c=1 s=22 lld
Choose the module you want to upgrade: (eg. 1,3,16; at most 8 modules to upgrade, press 'q' to exit upgrade) show card info		

Invalid forward port list!

- 1. Re-enter the command, wait for the prompt, and then enter a response in the correct syntax.
- 2. See the related command / function section of this manual.
- 3. If the problem persists, contact Technical Support.

L2CP is not supported on this card!

You tried to perform an L2CP function but the device does not support L2CP.

- 1. Make sure this is the command / function that you wanted.
- 2. Use the **go** command to switch to a device that supports L2CP.
- 3. Try entering the command again. See "Configuring L2CP" on page 268.
- 4. If the problem persists, contact Technical Support.

Please give parameters for L2CP configuration:%s

You tried to perform an L2CP function but have not defined the L2CP parameter(s).

- 1. Verify the L2CP command parameters. See "Configuring L2CP" on page 268.
- 2. Try entering the command again.
- 3. If the problem persists, contact Technical Support.

Cannot show circuit-ID on this card!

You tried to display the Circuit ID information, but the function is not supported.

- 1. Make sure this is the command / function that you wanted.
- 2. Use the **go** command to switch to a device that supports Circuit ID display.
- 3. Try entering the command again. See "Circuit ID" on page 268.
- 4. If the problem persists, contact Technical Support.

Cannot set circuit-ID on this card!

You tried to display the Circuit ID information, but the function is not supported.

- 1. Verify the Circuit ID parameters. See "Circuit ID" on page 268.
- 2. Try entering the command again.
- 3. If the problem persists, contact Technical Support.

Cannot set circuit-ID on this card!

You tried to display the Circuit ID information, but the function is not supported.

- 4. Verify the Circuit ID parameters. See "Circuit ID" on page 268.
- 5. Try entering the command again.
- 6. If the problem persists, contact Technical Support.

Fail to set Ethernet port loopback operation, please check if Link OAM admin state of remote peer port is enabled, link status and other issues.

You entered the CLI command to define the type of Ethernet loopback test, but the command failed. For example:

```
C1|S5|L1P2>set ether loopback oper init
Fail to set Ethernet port loopback operation, please check if Link OAM
admin state of remote peer port is enabled, link status and other issues.
C1|S5|L1P2>
```

- 1. Make sure the Link OAM admin state of remote peer port is enabled (see "set loam admin state" command).
- 2. Verify the command syntax.
- 3. Use the set ether loopback ? command to display the card's loopback capabilities. For example:

```
C1:S7:L1P1>set ether loopback type ?
alternate
noloopback
remote
```

- 4. Re-enter the **set ether loopback=** command with a loopback capability supported by the card (alternate, or remote or noloopback).
- 5. Verify the loopback capability with the **show ether loopback capability** command. For example:

```
C1|S5|L1P2> set ether loopback=
C1|S5|L1P2>show ether loopback capability
Loopback capability: alternate remotePeer
C1|S5|L1P2>
```

6. If the problem persists, contact Technical Support.

Can not set speed on this port!

You entered the CLI command to define the NID port's operating speed, but the command failed. For example:

```
C1|S5|L1P2>set ether speed 100M
Can not set speed on this port!
C1|S5|L1P2>
```

- 1. Verify the NID supports this speed.
- 2. Verify the command syntax.
- 3. Re-enter the set ether speed= command with a speed supported by the card.
- 4. If the problem persists, contact Technical Support.

Fail to set port advertisement capability!

This message indicates that the capabilities specified for the Set Ethernet Port Advertisement Capability (set ether adv-cap) command are not valid choices. For example:

```
C1|S5|L1P2>set ether adv-cap 1000XFD
C1|S5|L1P2>set ether adv-cap 1000XHD
Fail to set port advertisement capability!
C1|S5|L1P2>
```

- 1. Verify the NID supports this capability.
- 2. Verify the command syntax.
- 3. Retry the operation. For a complete list of the available commands, see "Appendix A: CLI Command Summary" on page 174.
- 4. If the problem persists, contact Technical Support.

Currently HTTPS certification type is self-certificated, so you need not set private key file! You entered a command to set the private key file, but the HTTPS certification type is currently set to "self-certificated". For example:

C1|S5|L1D>set https private-key file=privkey Currently HTTPS certification type is self-certificated, so you need not set private key file!

- 1. Make sure this is the HTTPS certification type that you want.
- 2. Use the set https certificate-type command to change the HTTPS certification type.
- 3. If the problem persists, contact Technical Support.

Auto-negotiation is enabled, you can not set port speed now!

You entered a command to set the port speed, with the Auto-negotiation feature enabled; the Auto-negotiation function takes precedence.

- 1. Make sure of the port speed that you want.
- 2. Use the set ether autoneg state command and/or the set ether speed command as required.
- 3. If the problem persists, contact Technical Support.

Cannot create VLAN database on this card!

This model of NID does not support the VLAN database. For example:

```
C1|S7|L1D>add vlan-db vid 2 priority=5 pri-override=enable
Cannot create VLAN database on this card!
C1|S7|L1D>
```

- 1. Make sure this is the function that you want.
- 2. Use the go command to switch to a NID that supports the VLAN database.
- 3. Re-enter the **add vlan-db** command.
- 4. If the problem persists, contact Technical Support. US/Canada: 1-800-260-1312, International: + 1 952-358-3601.

Cannot remove vlan on this card!

You entered a command to delete one or all VLANs from the NID, but the action cannot be performed. For example:

```
C1|S7|L1D>remove vlan all
Cannot remove vlan on this card!
C1|S7|L1D>remove vlan vid=3
Cannot remove vlan on this card!
C1|S7|L1D>
```

- 1. Make sure this is the function that you want.
- 2. Use the **go** command to switch to a NID that supports the VLAN database.
- 3. Use the **add vlan-db** command to add a VLAN VID if needed.
- 4. If the problem persists, contact Technical Support.

Cannot remove forward database rows on this card!

You entered a command to delete a VLAN forward database VID (forward database row) from the NID, but the action cannot be performed. For example:

```
C1|S7|L1D>remove vlan-db vid 3
Cannot remove forward database rows on this card!
C1|S7|L1D>
```

- 1. Make sure this is the function that you want.
- 2. Use the **go** command to switch to a NID that supports the VLAN FDB.
- 3. If the problem persists, contact Technical Support.

Error symbol period window low is out of range, its range is 125000000 - 268435455! Error frame period window is out of range, its range is 174762 - 104857560! Error frame period threshold is out of range, its range is 0 - 268435455! Error frame window is out of range, its range is 10 - 600! Error frame threshold is out of range, its range is 0 - 268435455! Error frame seconds summary window is out of range, its range is 100 - 9000! Error frame seconds summary threshold is out of range, its range is 0 - 268435455!

A parameter entered in the "Event Configuration" has exceeded the range limitation.

- 1. Enter a parameter within the valid range displayed.
- 2. If the problem persists, contact Technical Support.

No data in VLAN forward database table now!

You entered the command to display FWDDB information, but the VLAN forward database table has no data to report. For example:

C1|S16|L1D>**show fwddb config fdbid 1** No data in VLAN forward database table now!

- 1. Make sure this is the function that you want.
- 2. Use the Forwarding Database Commands on page 92 to create the VLAN FDB entry.
- 3. If the problem persists, contact Technical Support.

set forward database connection port failed. set forward database priority failed. set forward database entry type failed. Please input a number to specify the priority! The range of priority is 0 .. 7!

You tried to create a new FWDDB entry but the effort failed. For example:

```
C1|S16|L1D>add fwddb mac 00-c0-f2-21-02-b3 conn-port=1 priority=7 type=static
set forward database connection port failed.
C1|S16|L1D>
```

- 1. Make sure this is the function that you want.
- 2. Use the "Forwarding Database Commands" to create the VLAN FDB entry. See the *ION x32xx NID User Guide* for more information.
- 3. If the problem persists, contact Technical Support.

The specified conn-port does not exist!

You specified a connection port (conn-port) number outside the valid range.

- 1. Make sure this is the function that you want.
- 2. See "Configuring MAC Address Filtering" in the ION x32xx NID User Guide for more information.
- 3. If the problem persists, contact Technical Support.

The specified monitor-port does not exist!

You specified a monitoring port (monitor-port) number outside the valid range.

- 1. Make sure this is the function that you want.
- 2. See the related section (e.g., "Redundancy" or "Link Pass Through") for more information.
- 3. If the problem persists, contact Technical Support.

Cannot show cable length for fiber port!

You entered the command to display the length of the copper cable for a port that does not support it.

- 1. Make sure the NID supports the **show cable length** command (only for x2110).
- 2. Verify the command syntax. See the related User Guide manual.
- 3. Type **show ether config** to show the Ethernet port's configuration.
- 4. If the problem persists, contact Technical Support.

Auto-negotiation is enabled, you can not set port duplex now!

You entered the command to assign a duplex mode, but the command is not functional if Auto-negotiation is currently enabled.

- 1. Either leave the Auto-negotiation setting and use the current duplex setting, or disable AutoNegotiation and set the Duplex mode as required.
- 2. See the "Set Ethernet Port Speed / Duplex Mode" section on page 105 for more information.
- 3. Use the **show ether config** command to display the current Auto-negotiation and Duplex settings.
- 4. If the problem persists, contact Technical Support.

Parameter value is out of range.

One or more of the entered CLI command parameters was not within the valid range.

- 1. Verify the command syntax. Re-enter the command followed by a question mark (?) with a space between the command and the question mark. The possible keywords that you can enter with the command display.
- 2. Retry the command. For a complete description of each available command, see the *ION System CLI Reference Manual*, 33461.
- 3. If the problem persists, contact Technical Support.

Add SOAM MEP failed. Port not a member of the VLAN. Add SOAM MIP failed. Port not a member of the VLAN.

You tried to add a MEP or MIP but the VLAN does not recognize the associated port. For example:

```
S3240>add soam mep mep-id 1 local-parent-id 1 direction up port 5
Add SOAM MEP failed.
Port not a member of the VLAN.
S3240>
```

- 1. Select a different port number and continue operation.
- 2. Review the add soam mep command or add soam mip command description.
- 3. Use the **show soam port** command to verify the current SOAM ports' state configurations.
- 4. If the problem persists, contact Technical Support.

Fail to set errored frame period window!

Fail to set errored symbol period window low!

You entered an EFP Window parameter that was outside the valid range. For example, you entered:

C0|S0|L1P2>set loam efp window 300
Fail to set errored frame period window!
C0|S0|L1P2>

- 1. Verify the valid range. See "default values and valid ranges" on page 113.
- 2. Re-enter the command.
- 3. Use the show loam event config command to verify the setting.
- 4. If the problem persists, contact Technical Support.

AIS transmit setting is not supported on this card!

You entered a command to enable or configure AIS, but the device does not support the AIS function. For example:

```
C1|S3|L1D>set ais transmit=enable
AIS transmit setting is not supported on this card!
C1|S3|L1D>
```

- 1. Verify that this is the command you want. See "TAOS and AIS Commands" on page 194.
- 2. Either select another device that supports AIS, or enter another command that this device supports.
- 3. Retry the operation.
- 4. If the problem persists, contact Technical Support.

Disable transmitting the TN topology discovery protocol on this port would make the device not be discovered by the Management unit if the device is remotely managed through this port. Are you sure?

Error: this command should be executed on a port!

Fail to get TNDP Tx state!

Fail to set TNDP Tx state of this port!

TNDP is not supported on this card!

- 1. Warning message that the **set tndp=disable** command disables management of the device from the IONMM.
- 2. The **set tndp=disable** command is a port level command; use the go command to switch to a port and re-enter this command.
- 3. Verify that this card supports the TNDP disable function.
- 4. Check the syntax and re-enter the command. Refer to the "TNDP Commands" on page 197.
- 5. If the problem persists, contact Technical Support.

Speed and duplex capability advertised by local auto-negotiation entity A combination of 10THD,10TFD,100TFD, 100THD,1000THD and 1000TFD for copper port, like 10TFD+100TFD+100THD+1000TFD; and N/A for none capability; Cannot set this attribute for fiber port

You entered a command to set the rate for a port that does not support this rate command.

- 1. Verify that this is the command you want.
- 2. Either select another device that supports this rate command, or enter another command that this port supports.
- 3. Retry the operation.
- 4. If the problem persists, contact Technical Support.

Pause capability advertised by local auto-negotiation entity

If no pause capability, setting nopause; otherwise, for copper port, use a combination of pause and apause, like pause+apause or pause or apause; for fiber port, use a combination of apause and spause, like apause+spause or spause or apause

You entered a command to set the Pause function that did not match the port or device's capability.

- 1. Verify that this is the command you want.
- 2. Either select another device that supports this rate command, or enter another command that this port supports.
- 3. Retry the operation. Refer to the "Pause Commands" on page 187.
- 4. If the problem persists, contact Technical Support.

please use \"show timezone\" to see detailed value of each timezone

You entered a command to set or show the UTC time data.

- 1. Verify that this is the command you want.
- 2. Enter the show timezone command.
- 3. Refer to the "SNTP Commands" on page 197.

The value of current time should time should follow this format, \"YYYY MMDD HH:MM:SS\", such as \"1999 1211 13:22:34

Please reboot the card for the changes to take effect!

You entered a **set sntp** command to set the UTC time data, and a reboot is required to implement the change.

- 1. If this is the command you want, start the reboot process.
- 2. Continue the operation.
- 3. Refer to the "SNTP Commands" on page 197.

Redundancy is enabled, so cannot set the administration state of fiber ports!

You entered a command to set the USB port state (**set usb-port state**=disable|enable) but that command does not work when the Redundancy feature is enabled.

- 1. Use the **go** command to switch to a different port.
- 2. Use the ION Web interface to disable the USB port.
- 3. Disable the Redundancy feature and then re-enter the set usb-port state command.
- 4. If the problem persists, contact Technical Support.

Cannot proceed because some other TFTP operation is currently in progress! Please input config file name!

TFTP file transferring failed! Please make sure the TFTP server is up and the file being transferred does exist.

TFTP Server Address is empty or invalid!

The firmware has been successfully upgraded and the system will be rebooted soon

The specified firmware on the TFTP server will be upgraded to the current module, operation is currently in progress!

The sys.log file will be transferred to the TFTP server, are you sure to proceed?

You tried a TFTP transfer operation, but the operation failed or is still in process.

- 1. Wait for the "operation is currently in progress!" message to clear.
- 2. If an entry was requested in the message, enter the required information (e.g., valid TFTP Server address, or config file name).
- 3. Verify that this is the operation you want (e.g., click **OK** at the "are you sure to proceed?" message).
- 4. Verify the related command in the applicable section of this manual (e.g., Syslog, or TFTP Upgrade section).
- 5. Retry the operation.
- 6. If the problem persists, contact Technical Support.

The specified firmware on the TFTP server will be upgraded to the current module, operation is currently in progress!

The sys.log file will be transferred to the TFTP server, are you sure to proceed?

You tried a TFTP transfer operation, but the operation failed or is still in process.

- 1. Wait for the "operation is currently in progress!" message to clear.
- 2. If an entry was requested in the message, enter the required information (e.g., valid TFTP Server address, or config file name).
- 3. Verify that this is the operation you want (e.g., click OK at the "are you sure to proceed?" message).
- 4. Verify the related command in the applicable section of this manual (e.g., Syslog, or TFTP Upgrade section).
- 5. Retry the operation.
- 6. If the problem persists, contact Technical Support.

Cannot get port VLAN configuration on this card! Cannot get VLAN tag management configuration on this port! Cannot set discard tagged frame on this card!

You entered a VLAN command on a device or port that does not support this function.

- 1. Try another command on the x222x/x32xx.
- 2. Try the command on another card that supports the attempted function.
- 3. If the problem persists, contact Technical Support.

Disable transmitting the TN topology discovery protocol on this port would make the device not be discovered by the Management unit if the device is remotely managed through this port. Are you sure?

Error: this command should be executed on a port!

No loopback supported on this card!

Error: this command should be executed on a port!

No TDM loopback supported on this card!

Fail to set Ethernet port loopback operation, please check if Link OAM admin state of remote peer port is enabled, link status and other issues.

Fail to get loopback type!

TDM config is not supported on this card!

You tried to enter the **set tdm** command but either the function is not supported or you entered it at the device level or you are being asked to verify the command entry.

- 1. Verify that this is the function you want.
- 2. Use the **go** command to switch to a port that supports this function.
- 3. Use the ION Web interface to perform this function.
- 4. Use the **go** command to switch to a device that supports this function.
- 5. Verify that the Link OAM admin state of the remote peer port is enabled, the link status is Up, and other prerequisites are met. Refer to the "Configuring TDM Loopback" section on page 418.
- 6. If the problem persists, contact Technical Support.

Fail to set port MAC learning!

You entered a CLI command to set the MAC Address Learning port(s) to enabled or disabled, but the entry failed.

- 1. Make sure this is the command / function that you want.
- 2. Verify the MAC Address Learning port setting(s).
- 3. Refer to the "Configuring MAC Address Learning" section on page 325 for more information.
- 4. Retry the operation.
- 5. If the problem persists, contact Technical Support.

Invalid forward port list!

You entered a CLI command to set the MAC Address Learning port(s) to enabled or disabled, but the entry was not accepted. For example:

C1|S3|L1D>**set mac_learning enable portlist 1,2,3** Invalid forward port list!

- 1. Make sure this is the command / function that you want.
- 2. Verify the port number(s) that you entered are valid for this particular x222x/x32xx device (i.e., you cannot enter the command in the example above (**set mac_learning enable portlist 1,2,3**) on a 2-port device such as the x3220.
- 3. Refer to the "Configuring MAC Address Learning" section on page 325 for more information.
- 4. Retry the operation.
- 5. If the problem persists, contact Technical Support.

Message: Are you sure to (flushOp) ? Cannot flush fwddb on this card! Cannot flush vlandb on this card! Flush is being processed... Send flush command successfully Fail to flush all entries to chip.

Meaning: You entered a command to clear all of the FWDDB or VLAN DB entries, but the function is either not supported or is already in process or successfully completed.

Recovery:

- 1. Wait for a few moments for the operation to complete.
- 2. Make sure this is the command you want.
- 3. Make sure this card supports the Flush function attempted.
- 4. Verify the Flush command parameters and re-enter the Flush command.
- 5. If the problem persists, contact Technical Support.
Message: Unknown command. message displays when entering system name/contact/location. **Meaning**: The "Unknown command." message displays when the system name/contact/location contains a "space" character within the text using the CLI command "**set system name**" or "**set system contact**" or "**set system location**" is entered. The entry for the system contact, system location, and system name must be a text string with no spaces between characters. Note that numbers, upper/lower case characters, and special characters (~!@#\$%^&*()_+") <u>are</u> allowed.

Recovery: From the CLI, re-enter the "set system name" or "set system contact" or "set system location" CLI command, making sure there are no spaces between the text characters.

The two passwords do not match!

You tried to generate a private key, but the operation failed. For example:

```
C1|S3|L1D>set https private-key password
Please input password:
xxxxx
Please input password again:
yyyyyyy
The two passwords do not match!
C1|S3|L1D>
```

- 1. Verify that this is the operation you want.
- 2. Retry the operation; be sure to type the password the same both times.
- 3. If the problem persists, contact Technical Support.

VID already exist!

You tried to add a VLAN-DB, but the operation failed. For example:

```
C1|S3|L1D>add vlan-db vid=20 priority=3 pri-override=enable
VID already exist!
C1|S3|L1D>
```

- 1. Verify that this is the operation you want.
- 2. Retry the operation; be sure to type a unique VLAN-DB VID.
- 3. If the problem persists, contact Technical Support.

Sys.log file lost on reboot

The device will dump all syslog files from RAM to flash on re-boot or if a system crash occurs. The last (most recent) syslog is stored as last_sys.log which can be retrieved using the tftp command. The filename sys.log is the current syslog file. The filename last_sys.log is the old syslog file. At one time we can only backup at most 10 cards! At one time we can only restore at most 10 cards! Backup finished Error: this command should be executed on a device! Error: this command should be executed on IONMM or a standalone SIC! Fail to set card entity index! Processing... The MAX provision configure file name is 64!

The specified module does not exist!

You entered a **"backup**" or **"restore**" command to do a backup or restore function, but a problem was encountered or the process is not yet finished. You entered a **"prov**" command to do a backup or restore function, but a problem was encountered or the process is not yet finished.

1. Wait a few moments for the command to complete and the *Restore finished* or *Backup finished* message to display.

2. Retry the backup or restore operation with 10 or fewer devices listed.

3. Use the **go** command to switch to a device that supports this feature (IONMM or a standalone SIC).

4. Enter a config filename with less than 64 characters. See the "Configuring Backup / Restore" section on page 103.

5. If the problem persists, contact Technical Support.

Error: Fail to transfer the file!

Problem: ION 6 slots - CLI - perform backup configuring modules as a range fails.

Meaning: If all modules are configured to be backed up as range does not work correctly and has no validation.

Example:

backup module-list 1-10 Processing... Backup finished (less than 15 seconds) tftp put iptype ipv4 ipaddr 192.251.200.52 localfile 6-slots-1-1-1-IONMM.config Tftp transferring... Error: Fail to transfer the file!

Recovery: Configure as a series of modules (e.g., 2,3,4,5) and NOT including a range of modules (do not include e.g., 2-5) then all modules are backed up correctly.

Adding Local User failed Cannot add an system user on this card! Default ION user is forbidden to be deleted! **Deleting Local User failed** ERROR: Can not delete current logined user! ERROR: Current user is not authorized to do this operation! ERROR: The two passwords are not the same, please check! Error: this command should be executed on IONMM or a standalone SIC! ERROR: This user could not be deleted! Fail to activate the user! Fail to create a system user! Fail to create user! Fail to get system user level! Fail to get system user name! Fail to get system user password! Fail to remove the system user! Fail to set system user level! Fail to set system user name! Fail to set system user password! **Modifying Local User failed** Password is too long! The confirm password is not identical with the password! There is no such user! The user name must begin with an alphanumeric char! The user password must begin with an alphanumeric char! This user already exists! To modify default ION user's level is not allowed! User name is too long! You tried to add (create), modify, or delete an ION user, but the operation failed.

1. Verify that this is the operation you want.

2. Retry the operation; be sure to type the parameters as shown in the "Configuring System / Login Users" section on page 143.

3. If the problem persists, contact Technical Support.

Can't open any requested files. cannot open /tftpboot/xxxx: No such file or directory now start to transfer the file ... file transfer failed! file transfer succeeded! now start to upgrade the system ... /usr/local/bin/flash_firmware /tftpboot/ upgrade failed! upgrade failed due to wrong file %s! upgrade failed when programming the flash! upgrade succeeded, system will be rebooted ... You entered a Serial File Transfer command, but the operation failed.

1. Either enter the requested information and click **<u>cps/bps</u>**, or click **<u>Skip</u> file**, or click **Cancel**.

2. See the HyperTerminal Helps or the <u>Hilgraeve web site</u> for more HT information.

3. Retry the operation; be sure to type the parameters as shown in the "Transfer Files via Serial Protocol (X/Y/Zmodem)" section on page 143.

4. If the serial file transfer causes HT to have problems recognizing ION CLI commands, type **q** and press **Enter**, and then log back in to HT and retry the operation.

5. If the problem persists, contact Microsoft or Hilgraeve Technical Support:

HyperTerminal Support

HyperTerminal is part of certain Microsoft Windows versions and is supported by Microsoft with 24hour worldwide responsibility for Windows communications components. Contact Microsoft Windows Support at (425) 635-7000, or contact your computer manufacturer. See the Microsoft Support knowledge base for articles regarding your topic: <u>http://support.microsoft.com/directory/</u> and do a key word search using your issue keywords.

HyperACCESS Support

Certain other Microsoft Windows versions do not include HyperTerminal support. HyperACCESS is the official, full powered Hilgraeve version of HyperTerminal Private Edition. Hilgraeve's HyperACCESS is available if you need a more powerful HyperTerminal alternative. For questions call (734)-243-0576 ext. 1# or see http://www.hilgraeve.com/support/.

Receiving Files - No response from remote system

Receivin	ng Files 🛛 🔀
i	No response from remote system

You entered a Serial File Transfer command, but the ZModem file transfer failed.

1. Click the **OK** button to clear the message dialog box.

2. See the HyperTerminal Helps or the <u>Hilgraeve web site</u> for more HT information.

3. Retry the operation; be sure to type the parameters as shown in the "Transfer Files via Serial Protocol (X/Y/Zmodem)" section on page 143.

4. If the serial file transfer causes HT to have problems recognizing ION CLI commands, type **q** and press **Enter**, and then log back in to HT and retry the operation.

5. If the problem persists, contact Technical Support.

The specified module does not exist!

You entered a Serial File Transfer command, but the operation failed.

1. Retry the operation; be sure to type the parameters as shown in the "Transfer Files via Serial Protocol (X/Y/Zmodem)" section on page 143.

2. If the serial file transfer causes HT to have problems recognizing ION CLI commands, type **q** and press **Enter**, and then log back in to HT and retry the operation.

3. If the problem persists, contact Technical Support.

Cannot find software version of this card!

The ION card's firmware version must be newer than a specified version, otherwise this message is returned. You used the go command to switch to another card, but the system checked its version and decided that the new CLI can not be run on this card at this firmware version.

- 1. Check the card's current firmware version.
- 2. Upgrade the firmware. See "TFTP Transfer / Upgrade Commands" on page 204 or "Upgrade / Update Firmware Commands" on page 207. Retry the operation.
- 3. If the problem persists, contact Technical Support.

Software version of this card is too old, please upgrade it!

The ION card's firmware version was checked and found to be too old to support this newer CLI command.

- 1. Upgrade the card firmware. See "TFTP Transfer / Upgrade Commands" on page 204 or "Upgrade / Update Firmware Commands" on page 207.
- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

This command is only valid on an IONMM! Cannot show slot info on this card!

You entered a "show slot info" command on an ION card other than an IONMM card.

- 1. Enter another (supported) show command on this card, or use the "**go**" command to switch to the IONMM.
- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

ERROR Software version of this card ("cardVersion") is not supported, please upgrade to the same version as the IONMM Getting card version failed

The failure get template config handler was called.

You attempted a function that is not supported by this version of firmware.

- 1. Enter another (supported) function at this card's firmware version, or use the "**go**" command to switch to another card.
- 2. Upgrade to a newer firmware version. See "TFTP Transfer / Upgrade Commands" on page 204 or "Upgrade / Update Firmware Commands" on page 207.
- 3. Retry the operation.
- 4. If the problem persists, contact Technical Support.

The confirm password is not identical with the password! The user name length must be in range [1..64]! The user name must begin with an alphanumeric char! You can only change your own password, not others!

You entered a command to create a new system user, but the command failed.

- 1. Verify the command syntax ("add sysuser name=NAMESTR level=(admin|read-write|read-only) pass=PASSSTR confirmpass=PASSSTR").
- 2. Retry the operation, making sure the "pass" and "confirmpass" entries match. See the related command section.
- 3. If the problem persists, contact Technical Support.

Cannot set irate because irate is bigger than port speed! Cannot set erate because erate is bigger than port speed! Egress Rate Limit - Web interface and CLI behaviors do not match Web Egress Rate Limit and CLI "show ether config" command rates do not match.

At the C3220 > Port 1 > ADVANCED tab > Egress Rate Limit field, you modified the bandwidth allocation display value successfully, but the Web interface and CLI behaviors do not match.

For instance, you link up the C3220-1040 copper port at 1000Mfull, and set copper port Egress Rate Limit to 900M. If you then uncheck the copper port "Capabilities Advertised" options of "1000M - Half Duplex" and "1000M - Full Duplex", and set the copper port link up at 100Mfull, in the Web, the copper port Egress Rate Limit will return to "Unlimited"; but in the CLI, the copper port Egress Rate Limit still shows "rate900M" (i.e., the port speed is 100M-full, but you still can display/set the rate limit to rate900M through the CLI).

- 1. Re-enter the irate / erate command bandwidth settings.
- 2. Retry the operation.
- 3. See "Bandwidth Commands" on page 72 for more information.

ERROR: There is already a same named user! ERRPR: User name cannot be modified!

You tried to add or change a user's User Name via the Web or the CLI, but the action was rejected.

- 1. Verify the command syntax (e.g., "add sysuser name=NAMESTR).
- 2. Retry the operation, making sure the user name entry is unique.
- 3. Retry the operation, making sure you are not trying to change the user name of the default user.
- 4. If the problem persists, contact Technical Support.

ERROR: Current user is not authorized to do this operation!

You tried an operation (e.g., login password entry, set user name) to which you are not authorized (only the super user level can perform this function).

- 1. Check with your system administrator.
- 2. Make sure this is the user you want check the Users table entry.
- 3. Verify the user's access level (admin, read write, or read only) in the command syntax ("add sysuser name=NAMESTR level=(admin|read-write|read-only").
- 4. See the "Configuring System / Login Users" section on page 103.

This card is in hardware mode and no setting allowed!

You tried to make a configuration change via the Web interface or the CLI, but the action was rejected. For example:

```
AgentIII C1|S3|L1D>set tdm inband enable

This card is in hardware mode and no setting allowed!

AgentIII C1|S3|L1D>
```

The device may have a jumper or switch that disables software management of the device. When Configuration Mode is hardware, the devices take some of the configurations from DIP switches or jumpers on the device. In software mode, configuration is controlled by management.

- 1. Make the required changes via DIP switch configuration. See the related section of the manual.
- 2. Change the Hardware/Software Jumper setting to Software mode.
- 3. Retry the configuration change via the Web interface or the CLI.
- 4. Contact Technical Support.

It must be a valid oid.

When you add a SNMP view/group/local user/remote user and the name contains "&" character, it can be added successfully, but the rest characters after "&" can not be seen from web table list, CLI shows correctly.

Bandwidth Ingress fault

With rate set at 100Mbps with Full Duplex and Frame Size = 9216 a bandwidth Ingress fault occurs. When Ingress rate limiting is set at or below 512Kbps, the S322x will pass approximately 1 Mbps of traffic. At 768kbps and above rate limiting is working. This problem only happens on Ingress (not Egress) and only happens when connected at 100Mbps Full Duplex. Packets of 1518k or less work fine. This is a known hardware component limitation that only occurs when using very large Jumbo Frame (>5k) and very low bandwidth (≤512k).

1. Change the rate, duplex mode, frame size, packet size, or Ingress Rate Limit. See the related section of this manual for details.

2. If the problem persists, contact Technical Support.

ERROR: Current user is not authorized to do this operation! % There is no matched command.

You tried to enter a CLI command but the entry failed because of your login user privilege level. An Admin user has full rights to read/write all configurations through Web/CLI. An Admin user can create new users and delete any users other than itself and ION.

A Read-Write user can read/write all configurations except for Upgrade and Backup/Restore via the Web or CLI. A read-write user can also change its own login password. When a read-write user logs in via the Web, the "UPGRADE" tab and the "BACKUP/RESTORE" tab are disabled. When a read-write user logs in via the CLI, all set commands except for upgrade and backup/restore can be executed. A Read-Only user can read all configurations except for Upgrade and Backup/Restore though the Web/CLI.

- 1. Try another command on the x222x/x32xx.
- 2. Check with the Admin if the command should be supported.
- 3. If the problem persists, contact Technical Support.

SNMP Messages

For any error condition, you can Contact Us on page 228.

Basic Recovery Steps

You entered a command, but the operation failed or is still in process.

- 1. Wait for a few moments for the operation to complete.
- 2. Use the Help or ? command to get assistance (help) on a group of commands or on a specific command.
- 3. Make sure this is the command you want and that the device/port/configuration supports this command.
- 4. Make sure this device/port supports the function attempted. Use the go command to switch locations.
- 5. Verify the command syntax and re-enter the command. See the related section of the manual for specifics.
- 6. Try using the Web interface to perform the function.
- 7. If the "continue y(es) n(o)" prompt displays, type y and press Enter to continue.
- 8. If the problem persists, contact Tech Support.

The user name must begin with an alphanumeric char!

You can only change your own password, not others!

Meaning: You entered a command to create a new system user, but the command failed.

Recovery: 1) Verify the command syntax ("add sysuser name=NAMESTR level=(admin|read-write|read-only) pass=PASSSTR confirmpass=PASSSTR"). 2) Retry the operation, making sure the "pass" and "confirmpass" entries match. See the related command section.

3) If the problem persists, contact Technical Support.

Message: Invalid input of timout value!

Meaning: You set an unsupported SNMP trap timeout boundary value.

Recovery: 1) In the "add snmp traphost" command, specify a valid timeout (-15s%-16s%-5u%-30s%-16s%-12s%-12u%-12u%s (change from 8u to 12us). For example:

C1 |S1 |L1D>addsnmptraphost version v3 type ipv4 addr 192.168.1.30 port 162 security_name TrpHstA6 security_level authPriv notify trap timeout=<0-2147483647>]

C1 S1 L1D>addsnmptraphost version v3 type ipv4 addr 192.168.1.30 port 162 security_name TrpHstA6 security_level authPriv notify trap timeout 1000 retry 25

Problem: An SNMP user cannot access the IONMM.

Meaning: The User security level is not compatible with the Group level. For example, you added an SNMPv3 User to a SNMP v1 Group, or added a User to a non-existing Group, so this user cannot access the IONMM. **Recovery**: 1) Make sure the Group exists. Verify the User's security level. See the "Configure SNMP" section for specific details.

Problem: Can't assign a SNMPv3 User to multiple Groups.
Meaning: The SNMPv3 standards do not allow you to assign a SNMPv3 user to multiple groups.
Recovery: 1) Create an additional, unique user. 2) Assign the new user to a different group. 3) Make sure that each user belongs to just one group.

Problem: Can't configure SNMPv3 for chassis ION NIDs.

Meaning: The SNMPv3 features currently only apply to the IONMM and standalone S323x/S322x/S222x devices. **Recovery**: 1) Contact U.S. Headquarters at 10900 Red Circle Drive, Minnetonka, MN 55343 USA; Telephone: 952-941-7600; Toll Free: 800-526-9267; Fax: 952-941-2322. EMEA Headquarters: Telephone: +49 611 974 8460; Fax: +49 611 950 4672. Email <u>sales@transition.com</u>.

Message: Its value must be a-f or A-F or 0-9 and the total length must be a dual from 18 to 128 **Meaning**: The engine ID is specified by hexadecimal characters. Each two input characters correspond to one octet character. For engine ID "80 00 03 64 03 00 c0 f2 00 01 02", the first two characters '80' correspond to the first octet character '\128' with ASCII value of 128 (8*16 + 0 = 128). The second two characters "00" correspond to the second octet character '\0' with ASCII value of 0 (0*16 + 0 = 0).

Recovery: 1) This applies only for SNMP v3 Engine ID converting. Enter this.pattern = /^[A-F\d]{18,128}\$/.

Message: It must be a valid oid. Meaning: You entered an invalid OID. Recovery: 1) Enter this pattern = /^[1-9]+(\.\d{1,5})*\$/.

Message: It must be a string which consists of letters and numbers. Meaning: You entered an invalid string. Recovery: 1) Enter this pattern = /^[\w]{1,256}\$/; 2) Enter this min = lengthMin;

3) Enter this max = lengthMax;

Message: It can be set to any characters combination except the character tab and space.

Meaning: The Community string, Local user name, Group name, View name, Remote user name, Authentication password, and Privacy password can include any combination of characters except the "tab" and "space" characters.

If you enter a "tab" and/or "space" character in these fields (via CLI or Web interface) the message "It can be set to any characters combination except the character tab and space." and "this.pattern is required: /^[\S]*{1,256}\$/." display.

Recovery: 1) Re-enter the command or field without the "tab" or "space" characters.

Problem: Entries display in red in SNMP v3 fields (e.g., at IONMM > SNMP > Users sub-tab, the User Name / Group Name / Password entry displays in red)

Meaning: The Community string, Local user name, Group name, View name, Remote user name, Authentication password, and Privacy password can include any combination of characters except the "tab" and "space" characters.

If you enter a "tab" and/or "space" character in these fields (via the Web interface) the characters display in red and the message "Getting records failed (http server error)" displays in the lower-left corner of the page. **Recovery**: 1) Re-enter the command or field without the "tab" or "space" characters.

Password:

The default group whose name is \"public\" or \"private\" and security-model is v1 or v2c cannot be removed! While the group whose name is \"public\" or \"private\" and security-model is v3 can be removed! Meaning: The default group cannot be removed (deleted) from the ION system configuration. Recovery: 1) Make sure this is the command you want. 2) Delete another existing Group. 3) See the related section of the manual for specifics. 4) If the problem persists, contact Tech Support.

Message: Invalid group parameter for user!

Meaning: You entered the CLI command for adding a local snmpv3 user, but the entry failed. **Recovery**: 1) Verify the "add snmp local user name" syntax. 2) Check if the ION firmware is the latest and upgrade if possible. 3) If the problem persists, contact Tech Support.

Message: AGENT PM ERROR: CLI command prov show snmp user failed

Meaning: The IONMM backup failed after no group SNMP local user added to the system. **Recovery**: 1) Check if the ION firmware is the latest and upgrade if possible. 2) Try the IONMM backup procedure again. 3) If the problem persists, contact Tech Support.

Problem: SNMP Local or Remote Users are deleted when you modify the SNMPv3 Local or Remote Engine ID. If you enter a "show snmp group name" command without entering a specific group name, the session is ended and the ION login prompt displays.

Meaning: You configured the SNMPv3 Local or Remote Engine ID before you configure the Local or Remote Users for this engine. For example:

Recovery: 1. Log in to the ION system again. 2. Configure the SNMPv3 Local or Remote Engine ID before you configure the Local or Remote Users for this engine. See "Configuring SNMP" on page 27. Retry the operation.

Syslog Messages and Sys.log Output

This section documents Syslog messages and related Sys.log output.

Syslog Messages

The set of messages displayable while using the Syslog function are provided below with possible meanings and suggested recovery procedures.

agentx_mapset Error agentx_ot_add Error

Meaning: possible internal error Recovery:

- 1. Verify the Syslog configuration. See "Configuring System Logging (Syslog)" on page 112.
- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

Fail for sending ionSyslogMgmtTable ,ignored...\n

Meaning: possible internal error.

Recovery:

- 1. Verify the Syslog configuration. See "Configuring System Logging (Syslog)" on page 112.
- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

Fail to get syslog server address type!
Fail to get syslog server address type!
Fail to get syslog server port!
Fail to get syslog level!
Fail to get syslog server address!
Meaning: the show syslog config attempt failed.
Recovery:

- 1. Verify the Syslog configuration. See "Configuring System Logging (Syslog)" on page 112.
- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

Fail to set syslog server port! Fail to set syslog mode! Fail to set syslog level! Fail to set syslog server address! Fail to set syslog server address type! Meaning: the set syslog level / mode / svr attempt failed. Recovery:

- 1. Verify the Syslog configuration. See "Configuring System Logging (Syslog)" on page 112.
- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

Invalid syslog server address!

Meaning: the **set syslog svr** attempt failed (e.g., **set syslog svr type**=ipv4 addr=192.168.01). **Recovery**:

- 1. Verify the Syslog configuration. See "Configuring System Logging (Syslog)" on page 112.
- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

Number of subid is not correct when ionSyslogMgmtTable_get, expect %d, get %d \n Meaning: possible internal error

Recovery:

- 1. Verify the Syslog configuration. See "Configuring System Logging (Syslog)" on page 112.
- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support. .

Please input a digital number to specify syslog server port! **Meaning**: the **set syslog svr port** attempt failed.

Recovery:

- 1. Verify the Syslog configuration. See "Configuring System Logging (Syslog)" on page 112.
- 2. Retry the operation with a valid, unused UDP port number.
- 3. If the problem persists, contact Technical Support.

Session reset, Reregister from begging\n

STATUS_INVALID, should be session reset, Reregister from beginning\n

Meaning: possible internal error.

Recovery:

- 1. Verify the Syslog configuration. See "Configuring System Logging (Syslog)" on page 112.
- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

Syslog is not supported on this card!

Meaning: You tried to configure a Syslog parameter, but this device does not support the Syslog feature. **Recovery**:

- 1. Verify that this is the command / function you wanted.
- 2. Switch to a device that supports Syslog.
- 3. Retry the operation.
- 4. If the problem persists, contact Technical Support.

Sys.log file lost on reboot

Meaning: The device will dump all syslog files from RAM to flash on re-boot or if a system crash occurs. The last (most recent) syslog is stored as last_sys.log which can be retrieved using the tftp command. The filename sys.log is the current syslog file. The filename last_sys.log is the old syslog file. **Recovery**:

- 1. Informational message.
- 2. If a problem persists, contact Technical Support.

System initializing or SNMP service busy, please wait..." : "Invalid password!

Meaning: possible internal error.

Recovery:

- 1. Wait for several seconds for the message to clear.
- 2. Verify the Syslog configuration. See "Configuring System Logging (Syslog)" on page 112.
- 3. Retry the operation.
- 4. If the problem persists, contact Technical Support.

unknown column in ionSyslogMgmtTable_get\n

Meaning: possible internal error.

Recovery:

- 1. Verify the Syslog configuration. See "Configuring System Logging (Syslog)" on page 112.
- 2. Retry the operation.
- 3. If the problem persists, contact Technical Support.

Sample Sys.log Output

A typical Syslog output is shown below.

```
1 CO|SO|L1D>cat sys.log
   Dec 31 18:00:07 (none) local5.notice bpd_linux[716]: BPD Started.
  3 Dec 31 18:00:08 (none) local5.notice loam[715]: LOAM started
   Dec 31 18:00:12 (none) user.notice subAgent2[726]: subAgent Started.
 5 Dec 31 18:00:16 (none) daemon.notice ION-EM[742]: Entity Manager running in Mast
 6 er Mode
 7 Dec 31 18:00:17 (none) daemon.notice ION-EM[742]: Discovered a card in slot-[0],
 8 relpos-[1]
   Dec 31 18:00:19 (none) user.notice subAgent2[726]; create contextID=1
 10 Dec 31 18:00:19 (none) user.notice subAgent2[726]: create contextID=2
 11 Dec 31 18:00:19 (none) user.notice subAgent2[726]: subAgent session connected.
12 Dec 31 18:00:19 (none) user.notice subAgent2[726]: Standalone mode, Send the col
 13 dStart trap.
 14 Dec 31 18:00:21 (none) daemon.err snmpd[719]: ion-ns/logical: session from local
15
   subAgent2 end_point_name [/var/agentx/master]
 16 Dec 31 18:28:58 (none) local5.err bpd_linux[716]: BPD ERROR: SAP(8) closed for a
 17 ppPduFrameLen == 0 when recvMsgFromAppSAP
 18 Dec 31 18:29:08 (none) user.err subAgent2[822]: agentx_send: Broken pipe
 19 Dec 31 18:29:08 (none) user.err subAgent2[822]: agentx_send: Broken pipe
 20 Dec 31 18:29:08 (none) user.err subAgent2[822]: agentx_send: Broken pipe
 21 Dec 31 18:29:08 (none) user.err subAgent2[822]: agentx_send: Broken pipe
 22 Dec 31 18:29:08 (none) user.err subAgent2[822]: agentx_send: Broken pipe
   Dec 31 18:29:08 (none) user.err subAgent2[822]: agentx_send: Broken pipe
 24 Dec 31 18:29:08 (none) user.err subAgent2[822]: agentx_send: Broken pipe
 25 Dec 31 18:29:08 (none) user.err subAgent2[822]: agentx_send: Broken pipe
 26 Dec 31 18:29:08 (none) user.err subAgent2[822]: agentx_send: Broken pipe
 27 Dec 31 18:29:08 (none) user.err subAgent2[822]: agentx_send: Broken pipe
 28 Dec 31 18:29:08 (none) user.err subAgent2[822]: agentx_send: Broken pipe
29 Dec 31 18:29:08 (none) user.err subAgent2[822]: agentx_send: Broken pipe
 30 Dec 31 18:29:08 (none) daemon.warn ION-EM[742]: AgentX master agent failed to re
31 spond to ping. Attempting to re-register.
```

A typical syslog message is shown below:

```
16 Dec 31 18:28:58 (none) local5.err bpd_linux[716]: BPD ERROR: SAP(8) closed
for a
17 ppPduFrameLen == 0 when recvMsgFromAppSAP
```

Syslog messages, their meanings, and suggested responses are provided below.

Message: local5.err bpd_linux[716]: BPD ERROR: SAP(8) closed for a ppPduFrameLen == 0 when recvMsgFromAppSAP

Meaning: Level 3 Error (err) severity; received a frame with a frame length of 0.

Recovery: 1. Refer to your organizations policy for this level of severity. 2. Retry the operation. 3. If the problem persists, contact Technical Support.

Message: daemon.warn ION-EM[742]: AgentX master agent failed to respond to ping. Attempting to reregister.

Meaning: Level 4 Error (warn) severity; the IONMM did not respond to a ping.

Recovery: 1. Refer to your organizations policy for this level of severity. 2. Retry the operation. 3. If the problem persists, contact Technical Support.

Message: Dec 31 18:31:39 (none) user.crit subAgent2[822]: agentx_protocol_disconnect: Subagent disconnected from master.

Meaning: Level 2 - Critical condition.

Recovery: 1. Refer to your organizations policy for this level of severity. 2. Contact Technical Support.

Message: 61Dec 31 18:31:39 (none) user.crit subAgent2[822]: agentx_protocol_disconnect: Subagent disconnected from master.

Meaning: Level 2 - Critical condition.

Recovery: 1. Refer to your organizations policy for this level of severity. 2. Contact Technical Support.

Message: user.err upgradeManager

Meaning: you unplugged the SIC card; system will send a syslog described as "user.err upgradeManager" that does not match the event.

Recovery: 1. Refer to your organizations policy for this level of severity. 2. Contact Technical Support.

TFTP Server Messages

Messages like the ones below may display during TFTP Server operation, depending on the TFTP Server package that you use.

Message: File does not exist

Meaning: A TFTP Server error - the TFTP Server Address that you specified does not contain the Firmware File Name specified.

Recovery: 1) Verify the TFTP server's correct file location (e.g., local disk at *C*:*TFTP-Root*). 2) Make sure of the filename / extension. 3) Check the TFTP Server's online helps for suggestions.

Message: File too large for TFTP Protocol

Meaning: A TFTP Server error - you tried to upload a file e.g., (IONMM.bin.0.5 – 50Mb) but the TFTP server failed. The file you tried to upload via the TFTP server exceeded the file size capability.
Recovery: 1) Check if some extra files ended up in the zip folder – some repeated – 6 FW files total.
2) Remove some of the files from the zip folder and try the upload again. 3) Send the remaining files in a separate file. 4) Check the TFTP Server's online helps for suggestions.

Appendix D: Linux Commands

ION supports certain standard Linux file system commands such as **cat**, **cd**, **ls**, **more**, **pwd**, and **rm**. These commands are restricted to the user directories; internal Linux file systems are not accessible.

The ION standard Linux file system commands are based on BSD 4; refer to the related documentation for more information.

cat Command

Command: cat

Description: Show the content of the FILES. Concatenate files and print on the standard output.

Example: C1|S7|L1D>cat [OPTION]

Options: Refer to the BSD 4 documentation for options and Interactive commands for the **more** command.

cd Command

Command: cd

Description: Change to another directory.

Example:

Options: Refer to the BSD 4 documentation for options and Interactive commands for the **more** command.

Is Command

Command: Is

Description: Unix and Unix-like operating systems maintain the concept of a current working directory, (i.e., where you are currently positioned in the hierarchy of directories).

When invoked without any arguments, **Is** lists the files in the current working directory. This command is restricted to the IONMM user directories; internal Linux file systems are not accessible.

The IONMM card stores all configuration backup files, HTTPS certification file, SSH key file, and Sys-log file. For example, the HTTPS certificate is stored in *'/agent3/conf/lighttpd'*. For SSH, the host keys (RSA and DSA) are stored in *'/agent3/conf/dropbear'*. For the SSH user key, there is a root user and the user key stored in *'/root/.ssh'*.

Example:

C1|S7|L1D>ls agent3 app bin dev etc lib linuxrc mnt proc root sbin sys tftpboot tmp usr var www C1|S7|L1D>

Options:

Without options, **Is** displays files in a bare format. This bare format however makes it difficult to establish the type, permissions, and size of the files. The most common options to reveal this information or change the list of files are:

-I long format, displaying Unix file types, permissions, number of hard links, owner, group, size, date, and filename

-F appends a character revealing the nature of a file, for example, * for an executable, or / for a directory. Regular files have no suffix.

-a lists all files in the given directory, including those whose names start with "." (which are hidden files in Unix). By default, these files are excluded from the list.

-R recursively lists subdirectories. The command Is -R / would therefore list all files.

-d shows information about a symbolic link or directory, rather than about the link's target or listing the contents of a directory.

-t sort the list of files by modification time.

-h print sizes in human readable format. (e.g., 1K, 234M, 2G, etc.)

Example:

```
C1|S3|L1D>ls etc
   ΤZ
  VERSION
  dropbear
  factory
  fstab
  group
   gshadow
  host.conf
  hostname
  hosts
  init.d
  inittab
  lighttpd
  lighttpd.conf
  motd
  openssl
  passwd
  profile
  protocols
  radius
  rcS.d
  resolv.conf
  rpc
  script
  services
   shadow
  snmpd.conf
  sysconfig
   terminfo
C1|S3|L1D>
```

Refer to the BSD 4 documentation for additional options and Interactive commands for the **more** command.

more Command

Command: more

Description: A filter for paging through text one screenful at a time.

Example: C1|S7|L1D>more [OPTION]

Options: Refer to the BSD 4 documentation for options and Interactive commands for the **more** command.

pwd Command

Command: pwd

Description: Show current directory.

Example:

```
C1|S7|L1D>pwd
/
C1|S7|L1D>
```

Options: Refer to the BSD 4 documentation for options and Interactive commands for the **pwd** command.

rm Command

Command: rm

Description: Removes each specified file. By default, it does not remove directories.

Example:

Options: Refer to the BSD 4 documentation for options and Interactive commands for the **rm** command.

Appendix E: Remote Manage Power Supply (RMPS) Feature

This feature is provided with ION C3220-1040 firmware version 1.3.17 or above and IONMM firmware version1.3.20 or above. ION Power supply support includes IONPS-D, IONPS-A, IONPS-D-R1 and IONPS-A-R1.

ION Chassis support includes the ION 6-slot chassis (ION106) or the ION 19-slot chassis (ION219) deployed as the remote chassis.

The RMPS feature lets you view and manage ION power supplies in a remote unmanaged chassis, inband, over the fiber, using a pair of C3220-1040 converters. This feature improves visibility of equipment installed in areas with limited accessibility such as a service provider's customer site.

From the C3220 management interface in the local managed chassis through its port 2 (the fiber port) you can view the remote C3220 as well as Remote PS 1 and Remote PS 2. This requires the C3220 to be installed in ION Chassis slot #1. You can actively manage converter cards and power supply modules in both the local managed chassis and the remote unmanaged chassis.

On the local ION Chassis, the IONDCR-R1 in the IONPS-D power supply is connected to the existing local alarm system, which alerts you to power supply issues.

You can log in to the IONMM and check the status of power supply modules and also check the status of all the cards in the chassis. In the IONMM Web UI, looking at the local C3220 (in slot 1) shows the link to the remote C3220 (also in slot 1) and both power supplies in the remote chassis.

Since there are no alarms at the remote chassis power supply modules, you must log into the local IONMM to check the status of remote power supplies. Traps from the remote power supply modules are accessible via the local IONMM.

You can monitor the remote power supply via the Web GUI as described in the ION x222x / x32xx User Guide. You can monitor the remote power supply via the CLI as described in the following sections.

Remote Power Supply Monitoring (CLI)

These C3220-1040 CLI commands are available for managing remote power supplies in an ION106 or ION219 chassis.

```
set rmps=(enable|disable)
set sensor stid
show card info
stat
```

Command:	Set remote manage PS on a C32xx remote card
Syntax:	set rmps=(enable disable)
Description:	Enable or Disable the Remote Manage Power Supply (rpms) feature on a C3220.
-	Use this command to enable forwarding Remote unmanaged chassis power supply
frames.	
	The default is to not forward Power Supply frames.
Example 1:	
	S2 L1D> set rmps ?
disable	
enable	
	S2 L1D> set rmps enable
-	S2 L1D>show card info
System name:	C3220-1040
Uptime:	00:33:54
CPU MAC:	00-c0-f2-21-2d-97
Port number:	2
Manage Remote	PS: enable
Serial number	: 12243313
Config mode:	software
Software:	1.3.17
Bootloader:	1.2.1
Hardware:	1.0.0
Agent III C1	
	S2 L1D> set rmps disable
Agent III C1	S2 L1D> show card info
System name:	C3220-1040
Uptime:	00:38:14
CPU MAC:	00-c0-f2-21-2d-97
Port number:	2
Manage Remote	
Serial number	
Config mode:	software
Software:	1.3.17

Bootloader: 1.2.1

Hardware: 1.0.0 Agent III C1|S2|L1D>

Command: Display Card Information

Syntax: show card info

Description: Existing command updated at v 1.3.17 to display the Remote Manage PS (rmps) status (either hardware, enable, or disable) that was set by the "set rmps" command.

Example 1:

Agent III C1 S2 L1D	>show card info	
System name:	C3220-1040	
Uptime:	00:31:55	
CPU MAC:	00-c0-f2-21-2d-97	
Port number: 2		
Manage Remote PS:	hardware	
Serial number:	12243313	
Config mode:	software	
Software:	1.3.17	
Bootloader:	1.2.1	
Hardware:	1.0.0	
Agent III C1 S2 L1D>		

Command: Set PS Sensor Threshold Parameters

Syntax: set sensor stid=(notification/relation/severity/value)

Description: Sets the current IONPS-A-R1 Sensor Transaction ID (stid) settings. The STID is used for power supply / sensor configuration via the set sensor stid command to define notification, relation, severity, and value parameters. There are 5 sensors on each power supply. The **show power config** command displays the power supply sensors information. The STID is shown in the Web interface at the Power Supply tab > Temp, Volt, Power, and Fan sub-tabs.

The stid is the port number, where Temperature = port 1, Voltage = port 2, Power = port 3, and Fan = port 4 (some older power supplies had a second fan as the fifth port). See the related power supply manual for specific stid (Sensor Transaction ID) parameters.

Use the **show power config** command to display the related current status.

Use the **stat** command to view the chassis slot assignments. Power Supplies are assigned slot 22 and slot 23 by default. The ION219 chassis has PS 1 ON and PS 2 ON LEDs to indicate power supply presence and function.

The **stat** command displays information about all slide-in modules installed in the chassis and all standalone modules connected to the remote slide-in modules, and their ports. On a remote standalone device, the **stat** command displays device and port information.

Example 1: Enable and disable the option on the remote C3220, get to the remote power supply, show the power config, and set the sensor thresholds. To see the remote C3220 and enable/disable "Manage Remote PS":

- 1. Start at the IONMM in slot 19.
- 2. Go to the local C3220 in slot 1 port 2.
- 3. Go to the remote C3220 level 2 device.

```
Agent III C1|S19|L1D>go s=1 l1ap=2 l2d

```

If there are 2 supplies, reach the second one with **go s=1 11ap=2 12ap=7 14d**. Refer to the related power supply manual for model-specific parameter information. See Related Manuals on page 326.

Command: ION statck

```
Syntax: stat
```

Description: Use the **stat** command to view the chassis slot assignments. Power Supplies are assigned slot 22 and slot 23 by default. The ION219 chassis has PS 1 ON and PS 2 ON LEDs to indicate power supply presence and function. The **stat** command displays information about all slide-in modules installed in the chassis and all standalone modules connected to the remote slide-in modules, and their ports. On a remote standalone device, the **stat** command displays device and port information.

Example:

```
Agent III C1|S19|L1D>stat

Appendix F: Local Management of Cards in a Remote Unmanaged Chassis

ION C222x software v1.3.26 adds a new feature that allows a chassis card to be seen in an unmanaged chassis (UC). Remote firmware upgrade of cards in an UC is also supported. See the ION x222x/x32xx User Guide for more information.
