1 Introduction

The GPS module A2200-A is Lantronix’s first implementation of CSR’s SiRFstarIV ROM chip on GPS module. This is highly integrated GPS receivers that can be used as SMT components. A very easy implementation (power, serial, ON_OFF, and antenna) allows receiving position, velocity and time information.

The A2200-A is a module designed for a 3.3V environment.

1.1 Feature Overview

The A2200-A is new module with the following outstanding features.

- Fast, responsive location experience
  - High-sensitive navigation engine with tracking down to -163dBm
  - 48 track verification channels
  - SBAS (WAAS, EGNOS, MSAS, GAGAN)

- Breakthrough micro power technology
  - Requires only 50 – 500µA to maintain hot start capability

- Active jammer remover
  - Removes in-band jammers up to 80dB/Hz
  - Tracks up to eight CW (continuous wave) jammers
1.2 Characteristics Overview

The module’s most important characteristics are:

- **A2200-A**
  - Operable at 3.3V / 41mA  @ 1 fix per second
  - UART interface at 3.3V CMOS level
  - SPI Slave support at 3.3V CMOS level
- Direct passive antenna support
- Switched antenna voltage for active antenna support
- Small form factor of 10.2 mm x 14 mm (0.40” x 0.55”)
- Supported temperature range: -40°C to +85°C
- Single-sided SMT component, for reflow soldering
- Tape & reel packaging

The A2200-A receiver module is available as off-the-shelf components, 100% tested and shipped in standard tape-and-reel package.

1.3 RoHS and Lead-Free Information

Lantronix’s products marked with the lead-free symbol either on the module or the packaging comply with the "Directive 2002/95/EC of the European Parliament and the Council on the Restriction of Use of certain Hazardous Substances in Electrical and Electronic Equipment" (RoHS).

All Lantronix GPS receiver modules, smart GPS antenna modules and telematics units are RoHS compliant.
1.4 Label
The A2200-A label holds the following information:

![Label Image]

The label is placed on the shield of the module. The data matrix code holds the product number, software part number, software release, hardware release, factory code, year & week of assembly and a 6-digit serial number.

<table>

<td>Cold (5) &lt; 35 s</td>
</tr>
</tbody>
</table>

Table 1: A2200-A GPS characteristics

(1) Typical with good antenna – see also paragraph “3.2 Antennas”
(2) The calibrated clock of the receiver has not stopped, thus it knows precise time (to the µs level).
(3) The receiver has estimates of time/date/position and valid almanac and ephemeris data.
(4) The receiver has estimates of time/date/position and recent almanac.
(5) The receiver has no estimate of time/date/position, and no recent almanac.

Note: Performance (sensitivity and TTFF) might slightly decrease below -30°C.

1.5.2 Mechanical Characteristics

</tr>
</tbody>
</table>

Table 2: A2200-A dimensions and weight

1.6 Handling Precautions
The GPS receiver module A2200-A is sensitive to electrostatic discharge (ESD). Please handle with appropriate care.
2 Ordering Information

2.1 GPS Receivers A2200-A
The order number is built as follows:

- A2200-Axxxx

A2200-A is the model name. The “xxxx” refers to the current part number on the module.

2.2 Packing of the A2200-A
The A2200-A GPS module come in a tape and reel package suitable for pick and place machines.

Figure 2: A2200-A tape specifications (1)
One complete reel holds 1300 pcs A2200-A modules.
There is 1 kinds of packaging for shipment:
  One box holds 1 reel
  Reel diameter: 33 cm
  Inner box dimensions: 36(W) x 36(L) x 4.5 (H) cm
  Box dimensions: 38.8 (W) x 38.8 (L) x 5.7 (H) cm
  Gross weight: 2.58 Kg
  Net weight: 0.78 Kg

Figure 3: A2200-A tape specifications (2)

Figure 4: A2200-A tape specifications (3)
2.3 Additional Equipment

| EVA2200-A | Evaluation Kit (including one module A2200-A) |

Table 3: Additional equipment

A detailed description of the EVA2200-A Evaluation Kit can be found in the appropriate manual.
3 Quick Start

In order to allow an easy and quick start with the A2200-A module, this chapter provides a short overview on the important steps to be taken to receive NMEA messages with position information on a serial port (UART).

**NOTE 1:** The A2200-A needs an external pull-up resistor to be configured for UART operation. Please consider the pull-up resistor in your design or pull the GPIO up right after reset by other means.

**NOTE 2:** The ON_OFF input of the A2200-A needs to be connected to output of a microprocessor. For a wake-up, including the initial one after power on, a LOW-HIGH transmission is mandatory.

3.1 Minimum Configuration

The following picture shows the minimum configuration for NMEA or binary outputs received and commands sent via an RS232 interface based on the GPS module A2200-A using a passive antenna.

![Figure 5: Minimum configuration A2200-A](image)

**NOTE:** It is recommended to supply Vcc continuously! Use SiRFaware™ or other low power modes to reduce power consumption of the module while no position information is required.
3.2 Antennas

Generally, the quality of the GPS antenna chosen (passive or active) is of paramount importance for the overall sensitivity of the GPS system. Losses through a bad antenna, long cables or tracks or a bad antenna position can’t be compensated afterwards!

3.2.1 Passive Antennas

The A2200-A supports passive antennas via an integrated LNA directly.

3.2.2 Active Antennas

The A2200-A also supports active antennas directly, i.e. by offering an antenna voltage feed pin (VANT – pin 9). It is recommended to use an active antenna with a supply voltage of 3 to 5 VDC and a maximum current draw of 50 mA. The antenna should have a gain ≥ 15dB but the total gain (antenna gain minus cable loss at the antenna input of the module) should not exceed 30 dB. The noise figure should be ≤ 1.5dB.
3.3 Serial Port Settings
In UART operation (defined by the external pull-up resistor as outlined in Minimum Configuration) the default settings are:

- NMEA, 4800 baud, 8 data bits, no parity, 1 stop bit, no flow control

3.4 Improved TTFF
In order to improve the TTFF (Time To First Fix), it is recommended to keep Vcc supplied at all times. This will allow taking advantage of sophisticated low power mode features of the SiRFstarIV ROM chip set.

3.5 Self-start Configuration
In order to minimize the GPIO required for operating A2200-A, WAKEUP (pin 19) and ON_OFF (pin 6) can be tied together for entering the self-start mode such that no ON_OFF pulse requires. The following picture shows the recommended connection for self-start configuration with UART host port enabled.

![Figure 7: Self-start configuration A2200-A](image)

For self-start mode, full power operation will be activated once Vcc applied. No power save mode (PTF / MPM / Hibernation) will be supported. While using external EEPROM or SPI Flash power supervision chip (Maxim, MAX809SEUR+T) is mandatory in order to prevent any memory corruption if the Vcc removes abruptly.
3.6 Configure the baud rate

Baud rate and protocol selection can be set upon start up through GPIO configuration. A2200-A can be configured to output NMEA at standard baud rates, if the A2200-A is using the UART host interface.

Table 4 lists the settings for GPIO 0 and GPIO 1 to configure the baud rate at start-up. After start-up, the GPIOs can be used for other purposes.

<table>
<thead>
<tr>

Table 7: Absolute maximum ratings

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 8: DC electrical characteristic A2200-A
7 Mounting

This chapter describes the suggested mounting process for the A2200-A receiver module. In a RoHS compliant product with a RoHS compliant process it is recommended to use chemical tin as the counter-part to the module’s pins. This will guarantee highest resistance against shocks.

7.1 Proposed Footprint for Soldering

Following soldering footprint parameters are recommended:

- Copper and solder paste footprint are identical
- Pad-shape / -size, inner pads: 1.2 mm x 1.2 mm
- Pad-shape / -size, outer pads: 1.5 mm x 0.8 mm
- Stencil thickness of 120 – 150 µm

![Recommended Solder PAD Layout](image)

Figure 11: Recommended Solder PAD Layout
7.2 Recommended Profile for Reflow Soldering

Typical values for reflow soldering of the module in convection or IR/convection ovens are as follows (according to IPC/JEDEC J-STD-020D):

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peak temperature (RoHS compliant process)</td>
<td>245°C</td>

</tr>
<tr>
<td>Time 25°C to peak temperature</td>
<td>8 minutes max.</td>
</tr>
</tbody>
</table>

Table 9: Reflow soldering profile A2200-A

The solder pads hold solder of a thickness of about 150 µm for improved solder process results.

As results of soldering may vary among different soldering systems and types of solder and depend on additional factors like density and types of components on board, the values above should be considered as a starting point for further optimization.
8 Use of GPS Antennas

8.1 Connecting a GPS antenna to the GPS receiver

The ANT pin is used to connect a GPS antenna to the receiver. The design of the antenna connection has to be done strictly according to RF design rules. A 50 Ω PCB strip line is required. The following drawings shall explain the guidelines. A major rule is to keep the strip line as short as possible. Additionally, antenna ground (ANT_GND) should be routed to the ground plane of the PCB (the ground plane is on a lower PCB layer) by vias as demonstrated in the drawing.

In order to achieve the impedance of 50 Ω, the width of the strip line needs to be calculated. It depends on the thickness or height of the PCB layer (both parameters are shown in following drawing). For the calculation, it is assumed that the PCB material is FR4.

Figure 12: Antenna connector strip line A2200-A

Figure 13: Strip line parameters A2200-A
In this case, the width should be about 1.8 times the height of the PCB:

\[ W = 1.8 \times H \]

In the example, one would get a width of \( W = 1.8 \times 0.8 \text{ mm} = 1.44 \text{ mm} \).
8.2 Antenna Connections

8.2.1 Passive Antennas
A passive antenna connected to ANT_IN input (pin 11) should be placed as close as possible to the GPS receiver. The signal power lost by the antenna cable or lost by the strip line on the PCB can not be recovered by the LNA (Low Noise Amplifier) integrated in the GPS receiver.

A suitable Ground-Plane design should be considered depending on the antenna type connected to ANT_IN input (pin 11).

8.2.2 Active Antennas
General GPS active antenna specification:

Limitations:

- Supply voltage (voltage fed into VANT pin) 5V (max.)
- Supply current 50mA (max.)

Recommendations:

- Gain ≥ 15dB  (should not exceed 30 dB including cable loss)
- Noise figure ≤ 1.5dB

The recommendations apply to the majority of active antennas that can be found in the market. Anyhow, the quality of the GPS antenna chosen is of paramount importance for the overall sensitivity of the GPS system.

The system design needs to reflect the supply voltage of the antenna. If the supply voltage is equal to Vcc, Vcc can be connected to VANT. If the antenna requires a different supply voltage, the antenna bias can be provided through the VANT pin.

VANT is switched by the module, so current is only drawn when required.
9 Quality and Reliability

9.1 Environmental Conditions

<table>

</tr>
</tbody>
</table>

Table 10: Environmental conditions

9.2 Product Qualification

Prior to product qualification the GPS receiver is preconditioned according to EIA/JEDEC standard JESD22-A113-B / Level 3.

Basic qualification tests:

- MSL Classification according to J-STD-020C (MSL3 @ 245°C)
- MSL Rework Compatibility according to J-STD-020C
- Temperature Cycling –40°C ... +85°C
- Temperature Humidity Bias 70°C / 85% RH
- Low / High Temperature Operating –40°C / +85°C
- High Temperature Operating Life +85°C
- Vibration Variable Frequency
- Mechanical Shock

Please contact Lantronix for detailed information.

9.3 Production Test

Each module is electrically tested prior to packing and shipping to ensure state of the art GPS receiver performance and accuracy.
10 Applications and Hints

10.1 Initial Module Start
After initially applying power to the module, it is necessary to start the internal firmware by toggling the ON_OFF pin. Toggling is done by pulling the signal to HIGH for about 200ms. This first toggling can be done after a LOW – HIGH transmission is detected at the WAKEUP pin or by simply waiting for 1s after power-up. In case of configuration for UART mode, messages should be transmitted afterwards. If no messages should appear, a new toggling should be applied.

10.2 Proper Shutdown
The A2200-A module requires an orderly shutdown process to properly stop internal operation and complete any writes of critical data to BBRAM or EEPROM data area. Abrupt removal or drop of main power while the system is running has risks ranging from minor impact on TTFF to fatal, permanent corruption of EEPROM code area on the module.

A controlled and orderly shutdown while the A2200-A is running in full power mode can be initiated by

- A 200ms pulse on the ON_OFF pin, or
- Appropriate messages either in NMEA or OSP mode.

The shutdown is completed after maximum 1s. Therefore the module should be supplied with voltage for that time after the shutdown sequence was initiated.

10.3 SiRFaware™ Support
SiRFaware™ is a low-power operating mode that seeks to maintain low uncertainty in position, time, and frequency, and to maintain valid current Ephemeris using either data collected from satellites in view or Extended Ephemeris methods.

The SiRFaware™ mode is entered using the One Socket Protocol, an extension of the SiRF Binary Protocol. Please refer to the appropriate manual. In order to request a fix and to exit SiRFaware™ it is necessary to toggle the ON_OFF pin. Toggling is done by pulling the signal to HIGH for about 200ms.

10.4 Push-to-Fix Mode
Push-to-Fix mode is designed for the application that requires infrequent position reporting. The receiver generally stays in a low-power mode, up to 2 hours, but wakes up periodically to refresh position, time, ephemeris data and RTC calibration.

The push-to-fix mode is initialized and entered using the SiRF Binary Protocol. Please refer to the appropriate manual, paying particular attention to the paragraph titled “Set TricklePower Parameters”. In order to request a fix outside the specified duty cycles, it is necessary to toggle the ON_OFF pin. Toggling is done by pulling the signal to HIGH for about 200ms.
10.5 Hibernate Mode

In order to enter Hibernate Mode it is necessary to send a shutdown command or to toggle to ON_OFF pin by pulling the signal to HIGH for about 200ms. Starting with firmware version 4.0.1 the according command is supported in NMEA and SiRF Binary mode. After a short delay the module will switch into hibernate mode. The RTC will keep on running and SRAM is backed with the typical current of 20 μA drawn from Vcc. To wake the module up again, toggling the ON_OFF pin is necessary (200ms pulse width).

10.6 Extended Ephemeris

The receiver is capable of supporting two versions of using Extended Ephemeris (EE) data. The first one is the version, where the EE data are calculated on a server, are transmitted to device incorporating the receiver, and are then loaded into the receiver. These data can be valid for up to seven days.

The second version is the internal extrapolation of available "natural" Ephemeris data. This is done automatically and no external support is required. The internally calculated EE data are valid for up to 3 days.

The receiver firmware will define which set of EE data to use or will neglect those in case "natural" data are available (need add an external EEPROM part). Both versions of EE data will help to further lower power consumption in SiRFaware™ mode.
10.7 Antenna Status Adaptation
This chapter shall give assistance in designing a circuit for detecting if an active antenna is connected to the module. The information about the antenna status can be derived from the ANTSTAT signal generated by this circuit. The examples use values for components that roughly result in the following ANTSTAT output:

- Logic low when:    \( I_{ant} < 9\text{mA} \)
- Logic high when:   \( 9\text{mA} > I_{ant} < 16\text{mA} \)
- Logic low when:    \( I_{ant} > 16\text{mA} \)

10.7.1 Antenna Sensor
The following circuit is a proposal on how you can feed an antenna with 3.3V and provide an output for the ANTSTAT pin. The value of the components may need an adaptation in the final application. For example, the input current of the chosen comparator goes into that equation. The thresholds defined in this circuit are quite close to the ones described above. Their value is determined by resistors R4, R5, and R3.

We strongly recommend simulating and testing the GPS receiver integrated in your product design before implementing the finalized product in the appropriate market application.

Figure 14: Application note: Antenna sensor adaptation
10.7.2 Antenna Sensor with Current Limiter

This proposal is similar to the first one, but includes a current limiter. Comments and notes as above apply.

We strongly recommend simulating and testing the GPS receiver integrated in your product design before implementing the finalized product in the appropriate market application. In any case it is the responsibility of the designer to test and verify the implementation.

Figure 15: Application note: Antenna sensor adaptation with current limiter
10.8 VANT Pin

The VANT pin is an input pin.

The supply voltage for an active GPS antenna on the ANT input has to be fed into the Vant pin. The easiest way to do that is to connect Vcc to VANT. The maximum current is 50 mA.

**Note**: Shortcut between ANT and GND may damage the A2200-A GPS receiver module. This should be avoided by using an antenna current limiter.

The circuit (chapter “10.7.2
Antenna Sensor with Current Limiter") works for Vcc from 3V to 5V. The antenna current will be limited to 50 mA approximately.

If other transistors are used, other resistor values may be necessary as well. We strongly recommend simulating and testing your realized version before using it.

**10.9 TM_GPIO5 pin (1 pulse per second pin)**
The 1PPS pin is an output pin.

In addition to precise positioning, GPS also allows for accurate timing due to the synchronized atomic clocks in the GPS satellites. While the current date and time is transmitted in NMEA sentences (UTC), an exact and accurate timing signal is provided via the 1PPS pin of the A2200 GPS receiver.

Under good signal conditions the 1PPS signal comes between 620ns and 710ns after the full GPS system second which is accurately (around 10ns) synchronized to UTC. Therefore the 1 second clock can be derived and maintained within around 90ns under good signal conditions.

**Note:**
The 1PPS clock accuracy directly depends on the position accuracy!
The GPS signals travel at the speed of light, therefore a position inaccuracy directly translates into 1PPS inaccuracies.

10m position deviation ≈ 33ns 1PPS deviation (typically)
100m position deviation ≈ 333ns 1PPS deviation (typically)

The NMEA messages containing absolute timing information (UTC time) are provided around 300ms after the 1PPS signal typically. This may change with the GPS receiver setup.

The 1PPS signal is provided on a “as is” basis with no accuracy specification. It’s NOT recommended to use 1PPS signal for accurate timing application.
The given values are based on a 10 satellite, static GPS simulator scenario.
10.10 5 Hz Navigation Update Rate

User can select 1Hz or 5Hz output rate of navigation computation and message, it supports rapid change of direction and improves accuracy on sport-related applications. 1Hz is the default Navigation Update Rate, if the user want to change to 5Hz Navigation Update Rate, please refer to command below:

Enable 5Hz Navigation Update Rate command:
- NMEA command MID103 ($PSRF103,00,6,00,0*23)
- OSP command MID136 (A0 A2 00 0E 88 00 00 04 00 00 00 00 00 00 00 00 0F 02 00 A1 B0 B3)

Disable 5Hz and return to 1Hz Navigation Update Rate, command:
- NMEA command MID103 ($PSRF103,00,7,00,0*22)
- OSP command MID136 (A0 A2 00 0E 88 00 00 04 00 00 00 00 00 00 00 00 0F 02 00 9D B0 B3)
11 Evaluation Kit EVA2200-A

For demonstration and easy evaluation of GPS performance Lantronix offers an evaluation kit (including one GPS A2200-A module). It contains a USB interface with according drivers to connect easily to a PC. The USB interface is an extension of the serial port 0, therefore sending NMEA sentences or binary information and accepting commands. At the same time it provides power to the module. Accompanied by both an active and passive antenna it offers a ready-to-go set.

For the development of new software and applications the Evaluation Kit also provides NMEA and binary messages on CMOS level via a terminal plug.

Figure 17: Evaluation kit EVA2200-A

For further information please contact Lantronix.
