Disclaimer and Revisions

Operation of this equipment in a residential area is likely to cause interference, in which case the user, at his or her own expense, will be required to pay for to take whatever measures may be required to correct the interference.

This equipment has been tested and found to comply with the limits for Class A digital device pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment.

This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with this User Guide, may cause interference to radio communications. Operation of this equipment in a residential area is likely to cause interference, in which case the user will be required to correct the interference at his own expense.

The user is cautioned that changes and modifications made to the equipment without approval of the manufacturer could void the user’s authority to operate this equipment.

Changes or modifications to this device not explicitly approved by Lantronix will voids the user's authority to operate the device.

Documentation Changes

The information in this guide may change without notice. The manufacturer assumes no responsibility for any errors that may appear in this guide. For the latest revision of product documents, please check our online documentation at www.lantronix.com/support/documentation.

1: About This Guide

This guide describes how to install, configure, use, and update the Lantronix® Spider™ and SpiderDuo® distributed keyboard, video, and mouse (KVM) -over-IP devices. It describes how to remotely and securely provide monitoring and control of one target computer system by one or more remote users.

This chapter contains the following sections:

- Chapter and Appendix Summaries
- Conventions
- Additional Documentation

Note: The information contained in this guide apply to the Spider and SpiderDuo devices unless otherwise noted.

Chapter and Appendix Summaries

Additional Documentation

Visit the Lantronix web site at www.lantronix.com/support/documentation for the latest documentation and the following additional documentation:

- **Spider View User Guide**—Details instructions on using the Spider View utility.
- **Spider Quick Start Guide**—Provides an overview of using the Spider device.
- **SpiderDuo Quick Start Guide**—Provides an overview of using the SpiderDuo.
2: Overview

Lantronix Spider and SpiderDuo distributed KVM-over-IP devices are designed to remotely and securely provide monitoring and control of one target computer system by one or more remote users. The remote user (client) accesses the Spider or SpiderDuo device over a local or wide area network connection using a standard web browser.

Spider and/or SpiderDuo device is an evolution of the traditional remote KVM device into a compact package. It is light enough to be cable-supported from the back of a server and takes up no rack space.

Both devices differ from other KVM-over-IP devices in several ways. Unlike rack mounted KVM-over-IP devices, the allocation of one Spider device per computer allows add-as-you-grow scalability and guarantees non-blocked BIOS-level access to mission-critical servers regardless of the number of remote users or servers that need access.

This chapter contains the following sections:

- Spider Overview
- SpiderDuo Overview
- Product Information Label

Note: The terms Remote Console and KVM Console are synonymous and used interchangeably throughout the User Guide.

Spider Overview

The Spider device features, functionality, system configuration and cables, and technical specifications are described in the following sections:

- Features
- Functionality
- System Configuration and Cables
- Technical Specifications

Features

The Spider device is unique in that it is low-enough in power consumption to be powered from the attached server. The color-coded cable plugs for the keyboard, mouse, USB port and video are designed to plug directly into the target server. An optional external AC/DC power supply is available.

It uses Lantronix SwitchPort+ technology to incorporate two hardware-switched Ethernet ports, one for the primary network connection and the second for daisy-chaining Spider devices, or aggregating other Ethernet connections (for example, a dedicated management LAN port on the controlled system). This provides a cost-effective solution in environments in which numerous cable drops and distance limitations are challenging when adding servers.

The Spider device comes in the following four models:

- One model with both PS/2 and USB keyboard and mouse interfaces (software selectable)
- One model for USB-only systems
2: Overview

- One model with cable length of 21”
- One model with cable length of 58”
- Secure, full BIOS-level control of remote servers over an IP network
- Space–saving “zero footprint” package attaches directly to the server that saves rack space
- Flexible 1–port design allows growth
- Guaranteed non-blocked access to remote servers that ensures lowest “cost-per-remote user”
- Browser–based, no client software or special licensing required
- Virtual Media support allows local drive (floppy, CD, hard drive, USB stick) sharing with a remote server or remote installation of an OS from an .ISO image
- Direct KVM minimizes the number of clicks to the remote–server console
- Built-in RS-232 serial port that can be configured for serial console pass-through or remote dial-in access
- Ideal for distributed IT system environments such as small branch offices, campuses, test labs, and server hosting environments
- Server–powered design - no external power supply required
- Lantronix SwitchPort+ technology allows Spider devices to be cascaded or share a host Ethernet connection

Functionality

The Spider device captures the video output from the attached computer, compresses and sends it over the network to a Java KVM console window launched by the browser or to a command line interface on the user system, which displays a replica of the server video output on the user monitor.

The Spider device also uses Java KVM console to accept keystrokes and mouse movements on the user system; recognizes those intended for the target computer; transmits the keystrokes and mouse movements; and emulates a physically attached keyboard and mouse.

Note: The Spider device supports up to 1600 x 1200 resolution at 60 Hz if its hardware revision is G22, G23, E21 or higher. If the Spider device hardware is an earlier revision, it will only support resolutions up to 1280 x 1024 at 60 Hz. The hardware revision number can be found on the Product Information Label as shown in Figure 2-8.

System Configuration and Cables

Figure 2-1 shows the Spider system configuration, and Figure 2-2 shows the cable dimensions.

</table>
SpiderDuo Overview

The SpiderDuo features, functionality, system configuration and cables, and technical specifications are described in the following sections:

- Features
- Functionality
- System Configuration and Cables
- Technical Specifications

Features

SpiderDuo provides secure, remote KVM and over-IP capabilities as well as transparent local access. Coupled with the optional single port power control unit (PCU), remote users can also initiate system reboots over the network. SpiderDuo allows complete local, plus remote management of the host machine anytime from virtually anywhere.

It has one model with both PS/2 and USB keyboard and mouse interfaces (software selectable), and one model for USB-only systems. It has the following features:

- Secure, full BIOS-level control of remote servers over an IP network
- Space–saving “zero footprint” package attaches directly to the server that saves rack space
- Flexible 1–port design allows growth
- Guaranteed non-blocked access to remote servers that ensures lowest “cost-per-remote user”
- Browser–based, no client software or special licensing required
- Virtual Media support allows local drive (floppy, CD, hard drive, USB stick) sharing with a remote server or remote installation of an OS from an .ISO image
- Direct KVM minimizes the number of clicks to the remote–server console
- Built-in RS-232 serial port that can be configured for serial console pass-through or remote dial-in access
- Ideal for distributed IT system environments such as small branch offices, campuses, test labs, and server hosting environments
- Local access and up to 8 simultaneous remote users
- Optional power control unit (PCU)

Functionality

The SpiderDuo provides local access for distributed server management in addition to the following functionality:

- Captures the video output from the attached computer.
- Compresses the video and sends it over the network to a Java KVM console window launched by the browser or to a command line on the user system, which draws a replica of the server video output on the user monitor.
- Uses Java KVM console to accept keystrokes and mouse movements on the user system; recognize those intended for the target computer; transmit the keystrokes and mouse movements; and emulate a physically attached keyboard and mouse.
System Configuration and Cables

*Figure 2-4* shows an SpiderDuo system configuration, *Figure 2-5* shows the PS/2 cable dimensions, and *Figure 2-6* shows the USB cable dimensions.

*Figure 2-4*  SpiderDuo System Configuration

*Figure 2-5* shows the PS/2 cable dimensions.

*Figure 2-5*  SpiderDuo PS/2 Cable Dimensions
Figure 2-6 shows the USB cable dimension.

Figure 2-6  SpiderDuo USB Cable Dimensions

![USB Cable Dimensions](image)

Note: The PS/2 cables and USB cables cannot be mixed and matched with each other due to the unique properties of each. Use the cables that come with your SpiderDuo.

Technical Specifications

Table 2-7 lists the general components and the specifications.

*Table 2-7  SpiderDuo Technical Specifications (continued)*
Figure 2-8 Spider Family Product Information Label
3: **Installing the Spider Device**

This chapter describes how to install the Lantronix Spider KVM-over-IP device. It contains the following sections:

- **Package Contents**
- **Installing the Spider**
- **Detector Installation and IP Address Reset**
- **Target Computer Setup**
- **Client Server Setup**
- **Network Environment**
- **Spider Power**

For technical specifications of the Spider KVM-over-IP device, see *Chapter 2: Overview*.

### Package Contents

In addition to the Spider distributed KVM-over-IP module, the package contains the following items:

- Null modem DB9F to RJ45 serial cable (30.48 mm; 120 in)
- AC Power Cables (1830 ± 30 mm; 72 ± 1.2 in)
- Mounting kit (see *Chapter 4: Mounting Bracket Kit*)
- Quick Start Guide

*Note:* An optional external AC/DC power supply is available.

### Installing the Spider

Consider the following factors when planning the installation of the Spider device.

- **USB Keyboard and Mouse Interfaces**—Provides better remote cursor tracking. Some older systems may not support USB devices or there may not be two USB ports available. In these cases, the PS/2-interface model may be required. You configure either interface by using the software.

- **Serial Ports**—Performs the initial configuration to setup parameters and connects to a target COM port. It also allows remote users to Telnet or SSH to that port, eliminating the need for a separate box to perform serial command line management. The serial port can be used for PPP connections to the user interface so that remote users can use a modem or other serial interface. It can be the primary network connection or a backup connection in case the primary LAN connection is unavailable.

- **Optional Auxiliary DC Power Supply (Redundancy)**—Overcomes the loss of power when the attached server goes down by using the auxiliary DC power supply connected to an independent AC power source. The Spider device will always have power regardless of the state of the server.
Ethernet Ports—Connects to the LAN. The Spider device contains a hardware Ethernet switch that connects to the external ports and an internal CPU. The first port is required for network connection. The second port can be used for the following:

- Tie all of the Spider units in a rack together so that one network connection only is required. While this configuration is a “daisy” chain physically, logically each Spider device has its own IP address on the network. Because the Spider device data that comes from the end of the chain traverses all of the switches, latency increases and responsiveness degrades depending on the number of devices in the chain.

Lantronix recommends a maximum of 16 Spider devices in a chain. But, if the network switch that connects to the Spider device chain supports Spanning Tree, the first and last devices in the chain can connect to the same network switch to provide resilience against a single-point failure.

- Connect to the LAN management port on the server, so that an external management network can interface to the Spider device and the server by using one cable.

- Connect to the main LAN port on the server. If physical isolation of management and user data is not a concern, a single LAN cable can provide connectivity to the Spider device and server conserving a switch or router port.

- Aggregate any other Ethernet connection as a general-purpose switch port.

Batch vs. Individual Setup—Deploying a batch of Spider devices at once should be performed as a stage before attaching to the computers. The staging can be performed on a bench prior to configuration. Consider the following tips for configuring a batch of Spider devices:

- Keyboard, video, and mouse connections are not required for setup. All you need are a source of power and a serial connection to set up the network parameters, and an Ethernet connection to access the administration user interface.

- Tag each Spider device with its IP address or write it on the serial number label on the bottom.

Perform the following steps to install the Spider device and configure the initial network settings.

1. Plug the RJ45 cable into the Spider serial port which is shown in Figure 3-1. The RS-232 protocol is the standard for serial binary data signals.

   **Figure 3-1 Spider RS-232 Serial Port and Pinouts**

</tbody>
</table>

2. Plug the DB9F cable into the serial (COM) port of a PC or laptop running a terminal emulator, for example, HyperTerminal. The default serial port settings are: 9600 bits per second, 8 data bits, no parity, 1 stop bit, no flow control.

3. Plug the Spider video, USB, and PS/2 keyboard and mouse cables into the target computer. The Spider device boots.
4. The Pwr2 LED illuminates blue and the SysOK LED flashes green to indicate that the Spider device is booting. Bootup should complete within one minute. The SysOK LED stops flashing and remains illuminated. If you use the external power supply to boot, Pwr1 illuminates blue. lists the LED labels, colors, and actions.

</table>

5. When the bootup process completes, the terminal window displays the login prompt as shown in Figure 3-3.

![Spider Login Window](image)

Figure 3-3 Spider Login Window

\[
\text{Welcome!} \\
\text{Choose a login for the following features:} \\
- \text{Initial IP configuration: "config".} \\
- \text{Reset device: "reset".} \\
\text{(none) login: config} \\
\text{IP autoconfiguration (none/dhcp/boots) [dhcpc]: none} \\
\]

6. To change the default IP auto configuration from DHCP to a static IP address, type `config` and press Enter.

7. At the IP autoconfiguration prompt, type `none` and press Enter.

8. Follow the prompts to enter the IP address, subnet mask, default gateway, and LAN interface information as shown in Figure 3-4.

![Spider Prompts](image)

Figure 3-4 Spider Prompts

\[
\text{IP [192.168.1.22]:} \\
\text{Netmask [255.255.255.0]:} \\
\text{Gateway [0.0.0.0 for none] [0.0.0.0]:} \\
\text{LAN interface speed (auto/10/100) [auto]:} \\
\text{LAN interface duplex mode (auto/half/full) [auto]:} \\
\text{Are the entered values correct? Enter y for Yes, n for No or c to Cancel y} \\
\text{Configuring device ...} \\
\text{Done.} \\
\]

9. Type `y` and press Enter to accept the changes. The system takes several seconds to update the internal protocol stack and display the updated information. See Detector Installation and IP Address Reset on page 28 for more information about using Detector.

10. Plug an Ethernet cable connected to your network into the Ethernet port. The Lnk LED in the RJ45 illuminates. The RJ45 jack is shown in Figure 3-5.
Detector Installation and IP Address Reset

The initial IP address gets assigned during bootup of the Spider device. To change it, use the Detector application. You can download Detector from Lantronix at http://www.lantronix.com/support/downloads.html.

*Note:* Lantronix recommends that you run Detector from its CD or copy it to your local hard drive and run it from there rather than from a shared network drive. Otherwise you may get a security exception. If you must run the program from a shared network drive, you need to change your security settings using the .NET Framework Configuration or "caspol" tool.

Perform the following steps to install Detector.

1. Double-click detector2.exe on its CD. If you see this error message: "The application failed to initialize properly (0xc0000135)," click OK to terminate the application and install .NET Framework. Go to Step 2.
4. Open the Detector software. The Lantronix Detector window opens as shown in Figure 3-6.
5. Before searching for devices, go to the **Timeout** drop-down menu in the toolbar. Change the milliseconds for the search by clicking the number in the Timeout drop-down menu. The default is **3000**.

6. Click the **Search** icon. A list of Lantronix Ethernet devices on the network displays as shown in *Figure 3-7*.

**Figure 3-7 Detector Device List Window**

![Detector Device List Window](image)

7. Click to highlight the device that you want and click the **Network Settings** icon to change the IP address. The *Enter Network Settings* window displays the Device Type and MAC Address (Ethernet address) that identify the device as shown in *Figure 3-8*.
8. Enter an unique and valid IP Address on your network and in the same subnet as your PC. There is no default.

9. Enter the subnet mask that is the network segment connected to the Spider device. To accept the default, leave blank.

10. Enter the default gateway that is the router IP address for your network. To accept the default, leave blank.

11. Click OK. A message confirms the network configuration.

12. Click OK.

13. Confirm the IP address change by clicking the Search icon. Find the device in this list and verify the IP address. You can access the device by using its new IP address.

   **Note:** On the Interfaces Network page of the web interface, make sure Disable Setup Protocol is not selected in the Network Miscellaneous Settings section.

**Target Computer Setup**

Setting up the target computer involves ensuring that the video resolution and refresh rates are correct for the target computer monitor; that the mouse-to-cursor movement is sync’d properly; that the Telnet/SSH connections match the Spider device; and, that the cable connections are correct. Each of these items are discussed in more detail in the following:

- **Video Resolutions and Refresh Rates Configuration**
- **Mouse-to-Cursor Synchronization**
- **Telnet/SSH Connections to Serial Ports**
- **Cable Connections for KVM and USB**
Video Resolutions and Refresh Rates Configuration

The Spider device recognizes video resolutions on the target computer up to a maximum of 1600 x 1200 at 60 Hz if its hardware revision G22, G23, E21 or higher. If the Spider hardware is an earlier revision, it will only support up to 1280 x 1024 resolution at 60 Hz. For the complete list of supported video resolutions and refresh rates, see Chapter 3: Supported Resolutions and Refresh Rates on page 127.

Note: The other supported resolutions and refresh rates are recognized by the Spider device, but could be difficult if the timing does not comply with the extended display identification data (EDID) standard that Spider device supports.

Perform the following steps to configure the video resolution and refresh rate.

◆ Windows Server

1. Select Control Panel > Display > Settings. Modify the screen resolution value as required.

2. Select Control Panel > Display > Settings > Advanced > Monitor. Modify the screen refresh rate. Because the server video card is driving the Spider device and not a monitor, a refresh rate higher than 60 Hz has no effect.

◆ Linux Server

1. Edit the Xfree86 file “XF86Config” to disable formats that are not supported or not VESA standard timing.

2. Reboot is required.

Notes:

◆ Background wallpaper and desktop appearances do not have any particular limitations.

◆ Microsoft Active Desktop and Linux virtual desktop are not supported. If bandwidth is a concern, plain backgrounds are preferred.

◆ If you are using a special video card or OS, consult the documentation.

Mouse-to-Cursor Synchronization

Mouse-to-cursor synchronization can be an issue with digital KVM interfaces because PS/2 mice transmit incremental information about movement over a period of time rather than an absolute measurement.

The OS driver translates acceleration-to-distance based on the local screen resolution and applies linear or nonlinear acceleration mappings. When a remote client communicates with the target server, settings and screen resolutions on both sides of the connection must be taken into account to get natural mouse-to-cursor tracking.

Use the USB keyboard and mouse when supported by the target computer. Unlike the PS/2 interface, a USB mouse uses absolute coordinates rather than relative coordinates and does not present translation issues between the local and remote computers.

The PS/2 Spider model sets the keyboard and mouse interface to Auto. When it first attempts to use the USB interface, and if it does not detect a USB interface, it falls back to PS/2.

There are no restrictions on the mouse settings of the client systems and no special care must be taken when setting mouse parameters of target servers for USB mice. The PS/2 interface performance (tracking) and synchronization can be optimized by removing any special acceleration or nonlinear ballistics.
Perform the following steps to configure the mouse-to-cursor synchronization.

- **Windows Server**
  1. Select Control Panel > Mouse > Pointer Options.
  2. Set the pointer speed to medium and disable Enhanced pointer precision.

- **Linux Server**
  1. Set Mouse Acceleration to exactly 1 and threshold to exactly 1.
  2. Select Other Operating Systems on the Spider mouse settings page.

- **Solaris Server**
  1. Set the mouse settings by using the CDE control panel to “1:1, no acceleration” or “xset m 1”.

- **Mac OS X Server**
  1. Set the Spider device to Single Mouse Mode.

**Telnet/SSH Connections to Serial Ports**

To Telnet/SSH to a target computer serial port, you must Telnet/SSH to the Spider serial port first and use `connect serial` CLI. This connects your Spider device to the target computer serial port. The default settings are 9600 bps, 8 data bits, 1 stop bit, no parity, and no flow control. The pinout of the included Spider cables match a standard DB9 COM port.

**Cable Connections for KVM and USB**

Connections for KVM and USB are integrated into the Spider device. Do not use extension cables. Plug the Spider device directly into the ports on the host server. If using the Spider serial port, plug the cable into the COM port on the server.

The second Cascade Ethernet port can connect to the Spider device to the target computer management LAN port, or to a main LAN port, or to a Spider device chain. When connecting the Ethernet ports, straight through or crossover cables can be used, because the Spider device has auto-polarity and auto-crossover correction. Although the port marked Ethernet and the port marked Cascade are both Ethernet interfaces, you must use the port marked Ethernet if using only one Ethernet interface.

Perform the following steps when daisy chaining Spider devices.

1. Plug the outside network cable into the left Ethernet port of the first Spider device.
2. Connect the right Cascade port to the left port of the next Spider device in the chain.
3. Repeat as necessary. The last Spider device in the chain should have its right port unoccupied, unless cabling in a loop for redundant connection.

**Device Failure or Cable Break in the Daisy Chain**

If a device fails or there is a cable break in the daisy chain, there could be a loss of network connectivity for all devices downstream from the cable break or device failure. Avert this issue by installing Spanning Tree in the switch or router to which the Spider device chain attaches. Then, connect the last Spider device from its Cascade port to the same switch so that there is a redundant outside connection.
Spanning Tree protocol implemented in the switch disables one of the two network connections while the loop remains complete. Data flows in one direction only around the loop. If the loop breaks, Spanning Tree activates both connections, so that data flows in both directions. All devices in the Spider device chain are accessible except the one immediately downstream from the cable break or failed device. Do not try this workaround without Spanning Tree installed.

**Client Server Setup**

Two mechanisms provide the monitoring of client servers that are connected through the Spider device: platform-dependent management and platform-independent management.

- **Platform-dependent management**—Spider View software is a standalone Windows XP or later application that locates, manages, and accesses multiple Spider devices in an integrated view. Spider View software requires ActiveX controls enabled. Refer to the *Spider View User Guide* at [http://www.lantronix.com/support/documentation.html](http://www.lantronix.com/support/documentation.html) for instructions on installation and operation of Spider View software.

- **Platform-independent management**—Each Spider device contains an embedded web server that delivers web pages, a Java KVM Remote Console program, and a terminal program. To access and manage the client server, a web browser is required. For example, use the latest version of Internet Explorer, Netscape, FireFox, and Safari. To run the Remote Console window and manage the target server, a Java plug-in (SUN JRE 1.4 or later) is required.

**Network Environment**

The connection between the client and Spider device must be open to IP traffic and use TCP ports 80 (HTTP) and 443 (HTTPS). Firewalls and NAT devices should be configured to support this configuration. The TCP ports can be changed by accessing *Interfaces > Network*.

When idle, minimal network traffic gets generated. Traffic bursts exceeding 10 Mpbs can occur if images change rapidly on the host server and image quality gets set to the maximum. Lantronix recommends using Fast Ethernet connections and a switched network environment because in a LAN, traffic affects the responsiveness of the Remote Console window.

**Spider Power**

The Spider device consumes under 4 watts of power that it draws from the attached computer. It requires all cables to be plugged in to receive sufficient power.

Plug in both USB cables or a USB and a PS/2 cable. Pwr1 and Pwr2 LEDs indicate that power is available. Pwr1 indicates that power is available only on the first USB port. Pwr2 indicates that power is available on the second USB port or the PS/2 port. When both LEDs are lit, the Spider device is powered and can boot.

The Spider device can also get power from an external DC power supply. DC power supplies are available from Lantronix (part number 520-085-R). The DC power supply acts as a backup, because the Spider device loses power when the attached computer goes down.

Use the power-on reset to reboot the Spider device or reboot from the user interface, from the serial port, or by clicking the reset switch through the pinhole on the back of the body.
4: Installing the SpiderDuo Device

This chapter describes how to install the Lantronix SpiderDuo device. It contains the following sections:

- Package Contents
- Installing the SpiderDuo
- Detector Installation and IP Address Reset
- Target Computer Setup
- Client Server Setup
- Network Environment
- PCU Power

For technical specifications of the SpiderDuo, see Chapter 2: Overview.

Package Contents

In addition to the SpiderDuo distributed KVM-over-IP module, the package contains the following items:

- Null modem DB9F to RJ45 serial cable (30.48 mm;120 in)
- AC Power Cables (1830 ± 30 mm;72 ± 1.2 in)
- Local KVM cable
- Computer Input cable
- Mounting kit (See Appendix D: Mounting Bracket Kit)
- Quick Start Guide
- CD-ROM containing documentation and utilities
- External AC/DC Power Supply
- Optional power control unit (PCU100-01)

Warning: The connectors on the SpiderDuo device are not regular video connectors. To avoid damage to the SpiderDuo device, do not connect cables of any kind other than the cables provided Lantronix. Use the Lantronix power supply only, part number 520-104-R.

Installing the SpiderDuo

Consider the following factors when planning the installation of the SpiderDuo device.

- USB Keyboard and Mouse Interfaces—Provide better remote cursor tracking. Some older systems may not support USB devices or there may not be two USB ports available. In these
cases, the PS/2-interface model may be required. You configure either interface type by using the software.

- **Serial Ports**—Performs the initial configuration to setup parameters and connects to a target COM port. It also allows remote users to Telnet or SSH to that port, eliminating the need for a separate box to perform serial command line management. The serial port can also connect to the Power Control Unit (PCU) for use as an AC power passthrough. For more information, see [PCU Power on page 43](#).

- **Optional Auxiliary DC Power Supply (Redundancy)**—Overcomes the loss of power when the attached server goes down by using the auxiliary DC power supply connected to an independent AC power source.

- **Ethernet Ports**—Connects to the LAN. The SpiderDuo device has one port only that connects to the LAN.

- **Local KVM Port**—Connects keyboard, video, and mouse to the local client.

Perform the following steps to install the SpiderDuo device and configure the initial network settings.

1. Plug the RJ45 cable into the SpiderDuo serial port.
2. Plug the DB9F end of the RJ45 cable into the COM port of a PC/laptop running a terminal emulator, for example HyperTerminal. The default serial port settings are: 9600 bits per second, 8 data bits, no parity, 1 stop bit, no flow control.
3. Plug the power adaptor into the SpiderDuo power connector.
4. Plug the SpiderDuo video, USB, and PS/2 keyboard and mouse (if applicable) cables into the target computer. The blue LED SysOK illuminates and flashes to indicate that the SpiderDuo device is booting up. Bootup completes within approximately one minute. The SysOK LED stops flashing and remains illuminated. Connections for video, USB, and keyboard/mouse are integrated into the SpiderDuo device.
4: Installing the SpiderDuo Device

Figure 4-2 SpiderDuo Local KVM, USB, Computer Input and Serial Ports

5. Upon bootup, the terminal window displays the **IP Configuration** screen. At the command prompt type `config` and press **Enter**.

   **Figure 4-4 SpiderDuo Welcome Screen**

   Welcome!
   Choose a command for the following features:
   - Initial IP configuration: "config".
   - Reset device: "reset".
   [172.19.205.165 spider]> _

6. To change the default IP auto configuration from DHCP to a static IP address, at the **IP autoconfiguration** prompt type **none** and press **Enter**.

   **Figure 4-5 SpiderDuo Default IP Configuration Screen**

   Configuring device ...

7. Follow the prompts to enter the IP address, subnet mask, default gateway, and LAN interface information.

8. Type **Enter**, to accept the changes. The system takes about 20 seconds to complete. Type **Enter** once again at the prompt to display the updated IP address.

9. Plug an Ethernet cable connected to your network into the Ethernet port. The Link LED illuminates.

4: Installing the SpiderDuo Device

**Note:** To reboot or reset the SpiderDuo, press the reset switch through the pinhole on the bottom of the device. You can also use the user interface or serial port.

10. Test the system installation (PC, local keyboard and mouse, video, and SpiderDuo) by completing the following:
   a. Turn off the power to the PC and SpiderDuo device.
   b. Reconnect all devices.
   c. Turn on the SpiderDuo device first, and wait for it to boot completely (the SysOK LED will be on steady).
   d. Turn on the PC.

**Detector Installation and IP Address Reset**

The initial IP address gets assigned during bootup of the SpiderDuo device. To change it, use the Lantronix® Detector™ application. You can download Detector from Lantronix at http://www.lantronix.com/support/downloads.html.

**Note:** Lantronix recommends that you run Detector downloaded from Lantronix at http://www.lantronix.com/support/downloads.html and run it from there rather than from a shared network drive. Otherwise you may get a security exception. If you must run the program from a shared network drive, you need to change your security settings using the .NET Framework Configuration or “caspol” tool.

Perform the following steps to install Detector.

1. Double-click detector2.exe. If you see this error message: “The application failed to initialize properly (0xc0000135),” click OK to terminate the application and install .NET Framework. Go to Step 2.

4. Open the Detector software. The Lantronix Detector window opens as shown in Figure 4-6.
5. Before searching for devices, go to the Timeout drop-down menu in the toolbar. Change the milliseconds for the search by clicking the number in the Timeout drop-down menu. The default is 3000.

6. Click the Search icon. A list of Lantronix Ethernet devices on the network displays as shown in Figure 4-7.

7. Click to highlight the device that you want and click the Network Settings icon to change the IP address. The Enter Network Settings window displays the Device Type and MAC Address (Ethernet address) that identify the device as shown in Figure 4-8.
8. Enter an unique and valid IP Address on your network and in the same subnet as your PC. There is no default.

9. Enter the subnet mask that is the network segment connected to the Spider device. To accept the default, leave blank.

10. Enter the default gateway that is the router IP address for your network. To accept the default, leave blank.

11. Click OK. A message confirms the network configuration.

12. Click OK.

13. Confirm the IP address change by clicking the Search icon. Find the device in this list and verify the IP address. You can access the device by using its new IP address.

   **Note:** On the Interfaces Network page of the web interface, make sure Disable Setup Protocol is not selected in the Network Miscellaneous Settings section.

---

**Target Computer Setup**

Setting up the target computer involves ensuring that the video resolution and refresh rates are correct for the target computer monitor; that the mouse-to-cursor movement is sync'd properly; that the Telnet/SSH connections match the Spider device; and, that the cable connections are correct. Each of these items is discussed in more detail in the following:

- **Video Resolutions and Refresh Rates Configuration**
- **Mouse-to-Cursor Synchronization**
- **Telnet/SSH Connections to Serial Ports**
- **Cable Connections for KVM and USB**
- **Power Sequencing**
Video Resolutions and Refresh Rates Configuration
The SpiderDuo devices recognize video resolutions on the target computer up to a maximum of 1600 x 1200 at 60 Hz. For the complete list of supported video resolutions and refresh rates, see Chapter 3: Supported Resolutions and Refresh Rates on page 127.

**Note:** The other supported resolutions and refresh rates are recognized by the SpiderDuo devices, but could be difficult if the timing does not comply with the extended display identification data (EDID) standard that SpiderDuo supports.

Perform the following steps to configure the video resolution and refresh rate.

- **Windows Server**
  1. Select **Control Panel > Display > Settings**. Modify the screen resolution value as required.
  2. Select **Control Panel > Display > Settings > Advanced > Monitor**. Modify the screen refresh rate. Because the server video card is driving the SpiderDuo device and not a monitor, a refresh rate higher than 60 Hz has no effect.

- **Linux Server**
  1. Edit the Xfree86 file “XF86Config” to disable formats that are not supported or not VESA standard timing.
  2. Reboot is required.

**Notes:**
- Background wallpaper and desktop appearances do not have any particular limitations.
- Microsoft Active Desktop and Linux virtual desktop are not supported. If bandwidth is a concern, plain backgrounds are preferred.

Mouse-to-Cursor Synchronization
Mouse-to-cursor synchronization can be an issue with digital KVM interfaces because PS/2 mice transmit incremental information about movement over a period of time rather than an absolute measurement.

The OS driver translates acceleration-to-distance based on the local screen resolution and applies linear or nonlinear acceleration mappings. When a remote client communicates with the target server, settings and screen resolutions on both sides of the connection must be taken into account to get natural mouse-to-cursor tracking.

Use the USB keyboard and mouse when supported by the target computer. Unlike the PS/2 interface, a USB mouse uses absolute coordinates rather than relative coordinates and does not present translation issues between the local and remote computers.

The PS/2 model sets the keyboard and mouse interface to Auto. When it first attempts to use the USB interface, and if it does not detect a USB interface, it falls back to PS/2.

There are no restrictions on the mouse settings of the client systems and no special care must be taken when setting mouse parameters of target servers for USB mice. The PS/2 interface performance (tracking) and synchronization can be optimized by removing any special acceleration or nonlinear ballistics.

Perform the following steps to configure the mouse-to-cursor synchronization.

- **Windows Server**
  1. Select **Control Panel > Mouse > Pointer Options**.
2. Set the pointer speed to medium and disable Enhanced pointer precision.

- Linux Server
  1. Set Mouse Acceleration to exactly 1 and threshold to exactly 1.

- Solaris Server
  1. Set the mouse settings by using the CDE control panel to “1:1, no acceleration” or “xset m 1”.

Telnet/SSH Connections to Serial Ports

To Telnet/SSH to a target computer serial port, you must Telnet/SSH to the SpiderDuo serial port first and use connect serial CLI. This connects your SpiderDuo device to the target computer serial port. The default settings are 9600 bps, 8 data bits, 1 stop bit, no parity, and no flow control. The pinout of the included SpiderDuo cables match a standard DB9 COM port.

Cable Connections for KVM and USB

Connections for video, USB, and keyboard/mouse are integrated into the SpiderDuo device. Plug the SpiderDuo device directly into the appropriate ports on the host system. If using the serial port, cable it to the appropriate COM port on the server. Available extended-length cables are shown in Table 4-9.

Power Sequencing

To ensure that the system (PC, local keyboard and mouse, and SpiderDuo device) function properly at power up, it is recommended that the following procedure be performed.

1. Ensure that the PC and SpiderDuo are powered off.
2. Make connections for all devices.
3. Turn on the SpiderDuo first and wait for the SpiderDuo to boot up completely. The SysOK LED will be on steady.
4. Turn on the PC.

Client Server Setup

Two mechanisms provide the monitoring of client servers that are connected through the Spider device: platform-dependent management and platform-independent management.

- Platform-dependent management—Spider View software is a standalone Windows XP or later application that locates, manages, and accesses multiple Spider devices in an integrated view. Spider View application requires ActiveX controls enabled. Refer to the Spider View User Guide at http://www.lantronix.com/support/documentation.html for instructions on installation and operation of Spider View software.
Platform-independent management—Each Spider device contains an embedded web server that delivers web pages, a Java KVM Remote Console program, and a terminal program. To access and manage the client server, the latest web browser is required. For example, Internet Explorer, Netscape, FireFox, and Safari. To run the Remote Console window and manage the target server, a Java plug-in (SUN JRE 1.4 or later) is required.

Network Environment

The connection between the client and SpiderDuo device must be open to IP traffic and use TCP ports 80 (HTTP) and 443 (HTTPS). Firewalls and NAT devices should be configured to support this configuration. The TCP ports can be changed by accessing Interfaces > Network.

When idle, minimal network traffic gets generated. Traffic bursts exceeding 10 Mpbs can occur if images change rapidly on the host server and image quality gets set to the maximum. Lantronix recommends using Fast Ethernet connections and a switched network environment because in a LAN, traffic affects the responsiveness of the Remote Console window.
**PCU Power**

To remotely control power to a PC and other equipment, an optional PCU is available (part number PCU100-01). The PCU manages power remotely to a target PC and other equipment. In addition, the user can restart or power-cycle the PC and other equipment.  shows the layout and dimensions of the PCU.

![Figure 4-10 PCU Layout and Dimensions](image)

Complete the following tasks to connect the PCU.

1. Connect the power output plug to a target PC or other equipment.
2. Connect the RJ45 cable from the PCU to the SpiderDuo serial port.
3. Connect the power input plug to AC power. Green LED = PCU ON (AC power pass-through), Blue LED = Sys OK.
**Warning:** AC power passes through by default if the RJ45 cable is disconnected from the PCU.

The SpiderDuo device gets its power from an external DC supply. Replacement power supplies are available.
5: Web Browser Access

This chapter describes how to use the Lantronix Spider and SpiderDuo KVM-over-IP device to access and manage a target computer by using a Web browser or remote system.

Accessing the KVM Console

Perform the following steps to use a web browser.

1. Access the Spider or SpiderDuo device over the network by using a web browser by entering https://<ipaddress> (for a secure SSL connection) or http://<ipaddress> (for an unsecure connection). The browser must accept cookies for login.

2. Enter your user name (default is sysadmin) and password (default is PASS) at the prompt. The home page displays. From the home page the Remote Console or Telnet Console can be launched as shown in Figure 5-1.

Figure 5-1  Spider device Home Page

The home page contains the following items:

- Snapshot of the target system video in the KVM Console Preview window in the center
- Session and host name information
- Tabs called Interfaces, User Accounts, Services, and Maintenance on the left
- Buttons including a Logout button on the right.

When you are logged in, you can make changes to the configuration and user database. You can set up the device for local or remote authentication for other users and define the permission level. As sysadmin, you can also make changes to the hardware settings, establish configuration parameters, and perform maintenance operations.
6: Remote System Control

This chapter describes the components of remote system control. It contains the following sections:

- Overview
- Remote Console Window
- Basic Remote Console Operation
- Optimizing Video
- Keyboard Functions
- Other Remote Console Functions
- Telnet/SSH

Overview

The Lantronix Spider and SpiderDuo devices control the target system by using a Remote Console. The Remote Console has settings that apply each time a user launches it. Other settings can be applied within the window itself. By scaling the window down in size, it is possible to have multiple Remote Console windows open, allowing interaction with multiple target systems.

Remote Console Window

The Remote Console window shows a real-time replica of the target system video (mimicking a monitor plugged directly into the remote computer). When the local computer window displays in the Remote Console window, mouse movements and keystrokes are transmitted to a remote computer. The title bar of the window shows the IP address of the Spider device or SpiderDuo (useful when multiple windows are open on the client system).

The Remote Console window can be minimized, maximized, or scaled in either direction. There are Main viewport and scroll bars, button keys, and a toolbar which are described in the following subsections.

To launch the Remote Console window, perform the following steps.

1. Click KVM Console to launch the Remote Console window. The Remote Console window can open in the foreground or in the background. If it launches in the background, click on the icon to bring the window to the front.

2. Or, launch the Remote Console by clicking the link below the preview image on the KVM Console Preview window.

You can enable the Spider or SpiderDuo device to bypass the web page and take you directly to the remote system by clicking Services > Security > Authentication Limitation > Enable Direct KVM. This capability is called Direct KVM.
Main Viewport and Scroll Bars

When first launched, the full virtual screen of the target computer is mapped pixel-for-pixel to the console window main viewport. As a result, if the target is running at a resolution less than that of the client, the entire screen is visible in the Remote Console window. If the resolution is such that the screen does not fit, scroll bars are available in the Remote Console window to move the viewport around within the target’s screen. The virtual screen size of the target may also be scaled down to match the Remote Console window.

Button Keys

Along the top there are Button Keys that have been defined to send special key codes directly to the target computer.

Toolbar

The top toolbar has a number of buttons for one-click access to functions, and a drop-down menu where other options may be reached. The icons vary depending on which keyboard interface is active.

- **Access Virtual Media**—The left-most diskette icon is used to activate the Virtual Media toolbar.
- **Auto Adjust Video**—This button activates the Auto Adjust Video function. When first opening the Remote Console window, it is recommended to click this button to ensure the Spider device has locked on to the video format on the attached computer. Also, click this button if there is an offset from the proper horizontal or vertical start position relative to the target screen (black bars to the right, left, top, or bottom of the main viewport, or a distorted video).
Screen Display Adjustments—These 3 buttons (A,S,R) facilitate changes to the Screen display.

Sync Mouse, Single/Double Cursor—These icons appear when the PS/2 mouse interface is active.

Options
The drop-down menu provides access to a number of options and features.

Information Bar - Connection
The left side of the information bar indicates whether the connection is encrypted (Console (SSL)) or unencrypted (Console (Norm)).

Information Bar - Resolution
Displays the horizontal by vertical resolution of the target system's video.

Information Bar - Network Traffic
Displays the approximate number of bytes per second incoming and outgoing to the window. An indication of the number of frames per second (fps) updated is also displayed. Incoming data is generally comprised of video updates. Outgoing data is generally comprised of keystrokes and mouse movements. When the target screen is not changing, In should be low or zero. If not, click the auto-adjust button. The amount of network traffic is a function of the detail in the captured screen, the rate at which the screen is changing, and the video encoding settings.

Concurrent Access State

- One user is connected to the Remote Console
- Multiple users are connected to the Remote Console
- This user has exclusive access to the Remote Console. No other clients may access the target system until exclusive access is disabled.
- Another user has exclusive access to the Remote Console. No other clients may access the target system until exclusive access is disabled by that user, or until that user closes their Remote Console window.

Monitor Only State
The far right icon shows whether this client may interact or simply view the target computer. If Monitor Only is disabled, then the keyboard and mouse may interact with the target. If Monitor Only is enabled, the client is view-only.

Exclusive Access
Only one user at a time may access the Spider device or SpiderDuo.
Basic Remote Console Operation

When the Remote Console window is open, there are three key zones:

- Outside the Remote Console window, interaction is with the local computer’s operating system or applications.
- Inside the Remote Console window’s viewport, interaction is with the target computer.
- Inside the Remote Console window but outside the viewport, interaction is with the Remote Console control functions such as the toolbar or scroll bars.

Within the Remote Console viewport, interaction with the remote computer is generally the same as if there were a direct connection (with a minor lag due to network latency). Windows may be opened, applications run, settings changed, maintenance functions performed, even system reboots performed. Powering down the target computer results in powering down the Spider device or SpiderDuo unless the redundant supply is used.
Auto Video Adjustment
The left side of the target computer screen must be aligned with the left side of the Remote Console viewport so that the tops align as well. If not, the local and remote cursors will always have a fixed offset of that amount, even if the USB interface is used. Clicking the Auto Video Adjustment one or more times typically cures any offset.

Screen Display Adjustments
Three features are added to the toolbar to facilitate Screen display changes:

- **A**—Full Screen Mode (Ctrl+F10).
- **S**—Full Screen Stretch Mode (Ctrl+F10 to return to regular mode).
- **R**—Full Screen Mode with Changing Client Monitor Resolution (Ctrl+F10 to return to regular mode).

Fast Sync and Intelligent Sync
The Spider device uses two different algorithms for re-synchronizing local and remote cursors. Use the Fast Sync button on the toolbar to correct a fixed skew.

Intelligent Sync uses a different algorithm and is useful when the mouse settings have changed on the remote system or when Fast Sync does not work. It is accessed through the Options > Mouse Handling drop-down menu. The Sync button on the toolbar usually performs a Fast Sync, but will perform an Intelligent Sync if the video format has recently changed.

Single and Double Mouse Modes
Continuous synchronization of local and remote cursors may not be feasible. The Spider device provides a mode where only one cursor is visible when operating in the active Remote Console viewport. Click the Single/Double button on the toolbar to activate Single Mouse Mode. This is indicated by a single arrow in the Single/Double button. When in this mode, the Java KVM console “greedy” the local cursor when clicking within the viewport and will not release it until a “release-cursor” hot key sequence is given (Alt+F12 by default). As there is only one cursor, and that one is confined to the active viewport, there is no issue with local to remote cursor tracking. There also is no local cursor; Alt+F12 is required to free the cursor to move the focus from the active viewport. Clicking when the local cursor is within the viewport will re-grab the cursor. Single Mouse Mode may be exited by clicking on the Single/Double button.

If at some point the cursor seems to disappear, click Alt+F12 or check the Single/Double Button as Single Mouse Mode may have been entered in error.

**Note:** Single Mouse Mode requires Sun Java 1.4 or higher

Local Cursor
The Spider device has an option to change the appearance of the local cursor when the focus is on the remote computer. Select Options > Local Cursor and select one of the following cursor options:

- **Default**—the local cursor maintains its appearance regardless of the focus location
- **Transparent**—the local cursor is invisible when the focus is on the remote computer. This is similar to Single Mouse Mode except the cursor is not “grabbed” and will reappear when moved outside of the active viewport.
The other selections provide a change of appearance for a visual clue that the focus is on the remote computer; the cursor changes back when the focus is back at the client system (including those areas of the Remote Console window outside the main viewport.)

Selections made in the Local Cursor submenu are associated with the current user and will be saved for the next Remote Console session.

Optimizing Video

The Spider and SpiderDuo devices can automatically make adjustments to video settings including clock and phase, and encoding to ensure that a picture displays quickly. You can also manually specify the settings.

Auto and Manual Video Adjustment

The Spider device automatically recognizes and adapts to many standard video resolutions and refresh rates. When it first enters the Remote Console window, it recognizes and locks onto the video in order to provide a picture as soon as possible.

Once the window displays, click the Auto Video Adjustment button once or twice to provide a greater degree of optimization. The Auto Adjustment process analyzes the timing of the incoming video horizontal and vertical sync signals then adjusts the digitizing hardware parameters. If there is slightly nonstandard timing, these parameters may be manually fine-tuned.

If it is necessary to adjust video hardware parameters, this may be done from Options > Video Settings. This brings up a window with a number of slider bars.

Adjust the brightness and contrast of the Remote Client window as presented by the Auto Adjustment. This is a hardware parameter and applies to all Spider users. Overall brightness and the contrast levels of each of the red, green, and blue primaries may be modified up or down. The Remote Console window immediately reflects the change. Once there is a satisfactory color-mapping, click Save Changes to retain those colors permanently for that video format. To discard the changes made, click Undo Changes. To return a particular setting or all settings to the original factory defaults, click Reset this Mode or Reset All Modes.

See Appendix C: Supported Resolutions and Refresh Rates for more information.

Clock and Phase

The A/D converter uses these low-level settings in the digitization process. Adjustment should not be required unless advised by Lantronix Tech Support.

If the timing of the video signal is slightly off, the Auto Adjustment may not capture the frame at the right point. This will result in black bars along left, right, top, or bottom of the Remote Console viewport, and cutting off the opposite side of the captured image. The Offset sliders can be used to align the sides properly. Once there is correct alignment, click Save Changes to retain those settings permanently. To discard the changes made, click Undo Changes. To return a particular setting or all settings to the original factory defaults, click Reset this Mode or Reset All.

Video Encoding

Various video encoding schemes have been defined to try to tailor the bandwidth usage to what is available. In addition to the predefined schemes, compression levels, and color depth can be manually adjusted. The default settings for each user are established in the KVM Console.
Settings > KVM_User > Transmission Encoding web page.

To change the settings during a session, select Options > Encoding > Predefined, Encoding > Compression, Encoding > Color Depth, and Encoding > Lossy manual adjustments. These settings will be lost when the Remote Console window is closed; for nonvolatile changes use the KVM Settings > User Console > Transmission Encoding web page.

Scaling Target Video to Client Resolution

In addition to the 1:1 pixel mapping mode, which is the default when the Remote Console window is first launched, scaling factors may be applied to the captured video in order to match various sizes of windows on the client. This scaling may be a fixed ratio or dynamically adjustable, as selected from the Options > Scaling selection. The default is 100 percent, although it may result in a viewport smaller than the virtual screen and is moved around with scroll bars. The optimal viewing percentages are 25 and 50.

Keyboard Functions

The Spider and Spider Duo devices provide a number of useful functions for mapping or translating between the local keyboard/keycodes and the emulated keyboard presented to the target computer.

Soft Keyboard

With remote control of a computer, it may be that the target system and client system are in different countries, using different languages. By using a Soft Keyboard, the local user can have the keycodes available to send to the target that are not on the local keyboard, without worrying about OS and application character set mappings.

Select Options > Soft Keyboard > Mapping to get a submenu listing the languages supported. Make the desired selection, and then verify it with Show soft keyboard.

Select Options > Soft Keyboard > Show. This provides an image of the currently selected Soft Keyboard. The Soft Keyboard sends single keystrokes as well as combinations of keys such as Ctrl+C. For a single keystroke, click on the button with the desired character. Single keys such as alphanumeric characters and punctuation are sent immediately. Special keys such as Ctrl, Shift, and F1 to F12 must be selected twice. The first click sends the signal “key is clicked.” The second click indicates the signal “key is released” to the remote system. After the first click the button will change its color to indicate that the key remains clicked, and that a code has not been sent. After the second click the button will appear as usual, showing that the keycode was sent.

Click the Close button on the title bar to close the soft keyboard.

Local Keyboard

The Java Virtual Machine running the Remote Console applet on the client computer determines its keyboard language mapping automatically from the operating environment. There may be circumstances where it is unable to do so, such as when the keyboard mapping and OS language do not match. The Options > Local Keyboard selection allows manual designation of the language/layout of the keyboard on the client system.

Hotkeys

Hotkeys provide an alternative method for sending keycode sequences defined in the section on Remote Console Button Keys. Click Options > Hotkeys and select the Button Key to be sent.
that Button Key has been defined with “Confirm”, a confirmation dialog box pops up before the keycode is sent.

Other Remote Console Functions

Other remote console functions are described in this section. For example, monitor only specifications, exclusive access, capture of the screen to the clipboard and refreshing the video.

Monitor Only

When Options > Monitor Only is checked, the keyboard and mouse are disabled for this Remote Console window. The Monitor Only state is shown in the lower right corner of the Remote Console status bar. The user must have the appropriate permissions to change this setting.

Exclusive Access

When Options > Exclusive Access is checked, no other client may open a Remote Console window to this Spider device. Any open Remote Console windows on other clients will be disconnected. The Exclusive Access state is shown in the lower right corner of the Remote Console status bar. The user must have the appropriate permissions to change this setting.

Screenshot to Clipboard

Options > Screenshot captures a snapshot of the entire target system’s virtual screen to the clipboard for pasting into other applications.

Refresh Video

The entire Remote Console viewport area is redrawn when the Remote Console window is first opened, and when the Auto Adjust Video button is clicked. As the encoding settings and noise filter may sometimes result in visible compression artifacts, selecting Options > Refresh Video can be used to redraw the entire viewport area.

Telnet/SSH

In addition to interacting with the target system using the KVM Console, the Spider device also allows text communication with the target via the Telnet Console, also a Java program window. Telnet and SSH are network protocols that enable a tunnel from the client system to the Spider device serial port. Once set up, it may be accessed through the web interface at the Telnet Console window, or using a Telnet/SSH client to connect directly. Note that Telnet/SSH cannot be used to connect to the Spider device itself in order to control it, as the device has an HTTP and not a command line interface.

The Telnet Console is a Java program and has the same Java Runtime Environment requirements as the Remote Console. When the Telnet Console window is open, the user at the client system can send and receive characters directly to the serial port.

Set up and Enable

To use Telnet or SSH, the serial port must be put in passthrough mode with the appropriate connection parameters and cabling with Telnet and/or SSH access allowed. If desired, the TCP
port numbers also may be changed from their defaults. A user attempting to connect via Telnet or SSH must also have the appropriate permissions.

**Passthrough Use**

When using Telnet/SSH in passthrough mode, the Spider device just acts as a conduit for the serial data traveling between the client system and whatever is connected to the serial port. This may be a COM port on the remote computer, or a serially controlled power strip, or anything else with an RS-232 port.

1. From the client system, use a Telnet or SSH utility to connect to the IP address of the Spider device, at the assigned Telnet TCP port number.

2. The Spider device will present **LOGIN** and **PASSWORD** prompts. Enter a valid user name and password. The user must have permissions set to use Telnet or SSH.

3. The Spider device will reply with a Welcome and status, followed by a command line prompt. Selections are:
   - **Help**—Displays a list of commands
   - **Version**—Displays the current Spider firmware version number
   - **Connect Serial**—Enter passthrough to serial port mode
   - **Logout**—Terminates the Telnet or SSH connection

4. Enter **connect serial** to open the connection to the serial port.

5. You are now connected and may interact with the attached serial console. Keystrokes are not locally echoed and must be echoed by the connected serial device.

6. Use the SSH or Telnet ability to send and receive serial data between the client and the serial port. The Spider device does not echo this data back to the client.

7. When complete, enter **Esc-Exit** to return to the command line.

8. Enter **logout** or **I** to close the connection.

**Telnet Console Use**

When using the Telnet Console, the Spider device opens a window on the client system that provides direct access to the Telnet/SSH command line. This eliminates the need to have a Telnet or SSH utility running on the client system.

1. Click the **Terminal** button at the top of the Spider page. The user must have permissions set to use Telnet or SSH. The JRE will launch, and the Telnet Console window appears. Telnet Console and Remote KVM Console windows may be open concurrently.

7: Interfaces

This chapter describes the Interfaces tab including information about the pages for configuring network, serial port, KVM Console, Keyboard/Mouse, Video, and Virtual Media settings. It contains the following sections:

- Network Settings
- Serial Port Settings
- KVM Console Settings
- Keyboard/Mouse
- Video
- Virtual Media
- User Interface Settings

Network Settings

The first link on the Interfaces tab is Network Settings. Do not forget that changing the settings while connected to the network can result in dropping the connection. This occurs when you click Save. Ensure that your new settings are correct when making changes from a remote site before you click Save.

In Network Settings, there are four configuration areas:

- **Network Basic Settings**—Sets auto IP configuration, host name, IP address, subnet mask, gateway address, and primary and secondary DNS server addresses.
- **LAN Interface Settings**—Sets LAN interface speed and duplex mode.
- **Network Miscellaneous Settings**—Enables ports, Telnet/SSH access, proxy hose and port, and bandwidth limit.

To configure network settings, perform the following steps.

1. Click Interfaces > Network. Figure 7-1 shows the page that displays.

Note: A small green square to the right of a field name indicates that the current value is the default.
2. Modify the following fields.

**Network Basic Settings**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP auto configuration</td>
<td>Select DHCP or BOOTP to fetch network settings from the appropriate type of server. Select NONE for a fixed IP address.</td>
</tr>
<tr>
<td>Host name</td>
<td>DHCP servers can register a name for this Spider device to assist in finding it, or you can configure it with a short host name or a fully qualified domain name.</td>
</tr>
<tr>
<td>IP address</td>
<td>If you are using a fixed IP address, enter it in the usual dot notation.</td>
</tr>
<tr>
<td>Subnet Mask</td>
<td>If you are using a fixed IP address, enter the subnet mask of the local network.</td>
</tr>
<tr>
<td>Gateway IP address</td>
<td>If the Spider device is to be accessible from outside the local subnet, enter the IP address of the router providing access.</td>
</tr>
<tr>
<td>(optional)</td>
<td></td>
</tr>
<tr>
<td>Primary DNS Server IP</td>
<td>For name resolution, enter the IP address of the primary Domain Name Server. This is optional, but needed if names rather than static IP addresses are used for certain Spider device functions requiring network connections.</td>
</tr>
</tbody>
</table>
### Secondary DNS Server IP Address (optional)
- **Enter the IP address of the Domain Name Server to be used if the Primary DNS Server cannot be reached.**

### Lan Interface Settings

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current LAN interface parameters</td>
<td>Displays current LAN interface settings.</td>
</tr>
<tr>
<td>LAN interface speed</td>
<td>Manual setup may be required for older equipment. With autonegotiation on, the window displays the current state of the link. Note that the parameters of the second Ethernet port are not configurable, they remain at autonegotiate. Select the speed from the drop-down menu.</td>
</tr>
<tr>
<td>LAN interface duplex mode</td>
<td>Select the duplex mode from the drop-down menu.</td>
</tr>
</tbody>
</table>

### IPv6 Settings (Firmware v3.0 or higher)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable IPv6</td>
<td>Select to enable IPv6.</td>
</tr>
<tr>
<td>IPv6 address</td>
<td>IPv6 address displays when enable IPv6 is selected,</td>
</tr>
<tr>
<td>IPv6 address dynamic</td>
<td>Assigned automatically by the system.</td>
</tr>
<tr>
<td>Link-local IPv6 address</td>
<td>Network address intended only for communications within one segment of a local network or a point-to-point link. Assigned automatically by the system.</td>
</tr>
</tbody>
</table>

### Miscellaneous Network Settings

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Console &amp; HTTPS port</td>
<td>Port number at which the Spider device Remote Console server and HTTPS server are listening. The default is 443.</td>
</tr>
<tr>
<td>HTTP port</td>
<td>Port number at which the Spider device’s HTTP server is listening. The default is 80.</td>
</tr>
<tr>
<td>TELNET port</td>
<td>Port number at which the Spider device’s Telnet server is listening. The default is 23.</td>
</tr>
<tr>
<td>SSH port</td>
<td>Port number at which the Spider device’s SSH server is listening. The default is 22.</td>
</tr>
<tr>
<td>Bandwidth Limit</td>
<td>The maximum network traffic generated through the Spider device’s primary Ethernet port, in kilobits. If left blank, there is no bandwidth limitation applied.</td>
</tr>
<tr>
<td>Enable TELNET/SSH access</td>
<td>For security, the default is having Telnet and SSH disabled. Check the appropriate box (es) and set up the serial port for Telnet/SSH to use the Telnet console.</td>
</tr>
</tbody>
</table>
3. Do one of the following:
   a. Click **Save** to save settings.
   b. Click **Reset to Defaults** to restore system defaults.
   c. Click **Reset** to restore original settings.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable Setup Protocol</td>
<td>Spider View application uses a special protocol to locate and set up Spider device IP addresses. As a security measure you may wish to disable this protocol when deploying Spider devices. If the protocol is disabled, Detector and the Spider device network will not find the Spider device.</td>
</tr>
<tr>
<td>Enable remote console proxy access</td>
<td>Enable the Java KVM console program to use a proxy server to connect to the Spider device. If you must configure your web browser to use a proxy server, you will likely have to do the same on the Spider device.</td>
</tr>
<tr>
<td>Proxy host</td>
<td>Enter the proxy server's address.</td>
</tr>
<tr>
<td>Proxy port</td>
<td>Enter the proxy port number.</td>
</tr>
</tbody>
</table>
Serial Port Settings

After using the serial port to set up the network parameters, you can use the serial port for something else. You can establish a PPP connection to use a modem (Spider device only) or another serial connection to log into and operate the Spider device. If you want to access a console port remotely through the Spider device, SSH and Telnet passthrough is available.

To configure the serial port, perform the following steps.

1. Click **Interfaces > Serial Port**. The Serial Port Settings page displays.

2. Modify the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Login</td>
<td>Select this option to use the serial port locally only to set up network parameters or reset the unit.</td>
</tr>
</tbody>
</table>
3. Do one of the following:
   a. Click **Save** to save settings.
   b. Click **Reset to Defaults** to restore system defaults.
   c. Click **Reset** to restore original settings.

### KVM Console Settings

The Remote Console window into the target system has settings that may be changed for the way each individual user interacts with the Spider device. When a user is created by copying from an existing user, the Remote Console settings will be copied as well. You can change these settings on the **Interfaces > KVM Console Settings** page. Note that if you are using the Spider View application, these settings do not apply; see the **Spider View User Guide** for further information.
The way in which the Spider device transmits video data back to the client system can be tailored for the type of network connection. On a LAN where bandwidth is not an issue, compression is not required and the speed of updates can be maximized. For other connections, the optimum user interaction needs to trade off image quality and update speed to fit the size of the pipe. Because various users may be accessing the Spider device over different connections, these parameters are applied on a user-by-user basis. The default is set for maximum image quality and speed of updates, which results in high data rate and hence is suitable for LANs where bursts of up to 2 Mbytes/second are acceptable.

To modify the user console, perform the following steps.

1. Click **Interfaces > KVM Console**. The Remote Console Settings for User page displays.

![Figure 7-3 User Remote Console Settings Page](image)

2. Configure the following fields.

**KVM Console Settings**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KVM Console Settings for</td>
<td>Select the user from the drop-down menu. The settings on this page apply only to the selected user. When a user is created by copying from an existing user, the KVM Console Settings will be copied as well.</td>
</tr>
</tbody>
</table>
Transmission Encoding

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatic Detection</td>
<td>This option uses an algorithm to try to determine what sort of connection is being used, and sets up parameters to match. These settings may change from login to login depending on the state of the network at that point.</td>
</tr>
<tr>
<td>Preconfigured</td>
<td>Establishes a set of parameters optimized for each of a number of connection types. The default transmission encoding is LAN (high color), which is uncompressed with a 16 bit color depth. Other data networks may be chosen from the Network speed drop-down list, and the compression and color depth will be configured accordingly.</td>
</tr>
<tr>
<td>Manual</td>
<td>Allows the direct control of the compression factor and color depth. The simplest way to reduce bandwidth is to cut the color depth down to 8 bits; subtle color shades will be gone but the overall image is very usable. Dialing up the compression level also makes available even further reductions in color depth, all the way down to black and white (1 bit.) As compression level increases and/or color depth decreases, image quality and responsiveness to changes deteriorates but required bandwidth is reduced.</td>
</tr>
</tbody>
</table>

KVM Console Type

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Java VM</td>
<td>Select this option to use Java on the client system launching the applet. If no Java environment is installed, the console window will not launch. The default is enabled.</td>
</tr>
<tr>
<td>Sun Microsystems Java Browser Plugin</td>
<td>Force the system to use the platform-independent Sun version instead when launching the Remote Console applet.</td>
</tr>
</tbody>
</table>

Note: Users have two ways to deploy the Remote Console program. Both provide the same functionality and differ only in deployment method. The default is Java Web Start. Applet deployment is available in case the user cannot connect via Java Web Start. This usually should not happen unless the user has a special proxy server or firewall that blocks Java Web Start.

KVM Console Deployment

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java Web Start</td>
<td>Select this option to use Java Web Start deployment method.</td>
</tr>
<tr>
<td>Applet</td>
<td>Select this option to use the Applet deployment method.</td>
</tr>
</tbody>
</table>

Miscellaneous KVM Console Settings

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start in Monitor Mode</td>
<td>Results in the Remote Console window being view-only when launched for this user. This may be changed to interactive mode from within the Remote Console window, if the user has appropriate permission.</td>
</tr>
</tbody>
</table>
3. Do one of the following:
   a. Click **Save** to save settings.
   b. Click **Reset to Defaults** to restore system defaults.
   c. Click **Reset** to restore original settings.
**Keyboard/Mouse**

To modify the keyboard and mouse settings, perform the following steps.

1. Click **Interfaces > Keyboard/Mouse**. The Keyboard/Mouse Settings page displays.

   ![Figure 7-4 Keyboard/Mouse Settings](image)

   - **Host Interface**: Auto
   - **Keyboard Model**: Generic 104-Key PC
   - **Key Release Timeout**: Enabled
   - **Timeout after**: 50 msec
   - **USB Speed**: High speed
   - **USB Mouse Type**: Other Operating Systems
   - **Mouse Speed**: Auto
   - **Country Code**: Enabled
   - **Country**: None

2. Modify the following fields.
7: Interfaces

Keyboard/Mouse Settings

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host Interface</td>
<td>In general, the USB interface is preferred because it provides superior mouse tracking. The <strong>Host Interface</strong> drop-down provides three selections.</td>
</tr>
<tr>
<td></td>
<td>In the default mode, <strong>Auto</strong>, the Spider device attempts to determine whether the attached computer supports a USB keyboard/mouse. If it does, that</td>
</tr>
<tr>
<td></td>
<td>interface gets activated. If it does not, the Spider device falls back to PS/2. If you have a USB model Spider device and the attached computer does not</td>
</tr>
<tr>
<td></td>
<td>support USB, the system will be view only.</td>
</tr>
<tr>
<td></td>
<td>On the PS/2 model Spider device, select <strong>PS/2</strong> to force the PS/2 interface or <strong>USB</strong> to require USB. This selection has no effect on the USB model Spider</td>
</tr>
<tr>
<td></td>
<td>device.</td>
</tr>
<tr>
<td>Force USB Full Speed Mode</td>
<td>Some older systems do not support USB high-speed mode and may not recognize the keyboard/mouse. Enable this option for Spider device to negotiate in USB full speed mode.</td>
</tr>
</tbody>
</table>

Keyboard Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<tr>
<td>Timeout after</td>
<td>Enter time, in msec.</td>
</tr>
</tbody>
</table>

Country Code

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Country Code</td>
<td>Select the check box to enable the Spider device to recognize the country code. <strong>Enable</strong> if the host machine requires the keyboard to send a country code to use a certain language. Most operating systems do not require this except Sun Solaris.</td>
</tr>
<tr>
<td>Country</td>
<td>From the drop-down list, select the code of the desired country.</td>
</tr>
</tbody>
</table>
USB Mouse Type

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;USB mouse type drop-down menu&gt;</td>
<td>Different operating systems running on the target system require different mouse emulation protocols. One selection is available for newer versions of Windows and Mac OS/X, and another for Other Operating Systems (e.g., Linux).</td>
</tr>
</tbody>
</table>

Mouse Speed

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Mouse speed | Select the method of assigning mouse speed.  
- **Auto** mouse speed determines the speed and acceleration settings of the target system. It is the recommended setting for most applications.  
- **Fixed scaling** translates a one-pixel motion on the client system to a selectable number of pixels moved on the target system. As the 1 to n mapping is linear, this only work when there is no compression acceleration or other special effects turned on at the target system. |

3. View the USB Status for USB Speed, Keyboard, Mouse, and Mass Storage.

4. Do one of the following:
   a. Click **Save** to save settings.
   b. Click **Reset to Defaults** to restore system defaults.
   c. Click **Reset** to restore original settings.

To configure the Spider device USB model with a Sun Solaris operating system, perform the following steps.

1. Click **Interfaces > Keyboard/Mouse**. The Keyboard/Mouse Settings page displays.

2. On the **Keyboard/Mouse Settings** page configure the red outlined fields as shown.

3. The Sun Solaris operating system requires the keyboard to send a country code to use a certain language. At **Country Code** click **enabled** and use the **Country** drop-down list to select your language choice.

   **Note:** Sun Solaris settings are for the Spider device only.

4. Click **Save**.
Video

The Spider device works by capturing and digitizing the analog video coming from the attached computer. This analog video may have more or less low-level electrical noise present, depending on the nature of the video card or embedded video controller.

When viewed on a monitor, this noise (if random) is invisible as the display is being redrawn 60 to 100 times a second. Inside the Spider device, however, the algorithm sees that noise as something changing on the screen, so that requires sending off an update to the client system.

This can result in a constant stream of data even when the image on the target computer’s screen is not moving. In order to avoid this, at Interface > Video > Miscellaneous Video Settings the Spider device has a selection for noise filter. The larger filter openings will filter out more of the noise, at the cost of potentially missing small incremental changes and seeing some compression artifacts (blocky-ness). Filter settings of Medium or High will work for most applications. Be sure to try the Remote Console Auto Adjust Video button a few times before deciding that a constant stream of data represents electrical noise requiring a larger filter setting.

To modify video settings, perform the following steps.

1. Click Interfaces > Video. The Miscellaneous Video Settings page displays.
2. Select the **Noise Filter** level from the drop-down menu.

3. Do one of the following:
   a. Click **Save** to save settings.
   b. Click **Reset to Defaults** to restore system defaults.
   c. Click **Reset** to restore original settings.

**Virtual Media**

The Spider device provides a powerful capability called Virtual Media (or Virtual Disk). Using the USB port, the Spider device can present either a local floppy disk image or a redirected remote CD-ROM image to the target computer. This can allow system recovery in conditions as bad as having local disks down and no primary network connection.

With Floppy Disk Image, the user can upload an image to the Spider device’s memory, which then emulates a locally attached floppy drive. With CD-ROM Image, a Windows or other SAMBA share can emulate a locally attached CD-ROM, for instance to update software.

Drive Redirection allows you to share (redirect) your local drive (floppy drives, hard disks, CD ROMs and other removable devices like USB sticks) with the remote system over a TCP network connection.

Thus, with Drive Redirection, you can use a virtual disk drive on the remote computer instead of an image file. It is also possible to enable a remote machine to write data to your local disc.

*Note:* Drive Redirection supports only Windows as the client computer since it redirects based on a drive letter.

To open the Virtual Media page, perform the following steps.

1. Click **Interfaces > Virtual Media.**
To prepare for drive redirection, perform the following steps.

1. Enter the following fields.

### Virtual Media Active Image

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual Media Active Image</td>
<td>Once you set Image on Windows Share or Floppy Image File (on this web page), information about the currently assigned (active) image displays.</td>
</tr>
</tbody>
</table>

### Drive Redirection

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable Drive Redirection</td>
<td>Drive Redirection is enabled by default. Select this checkbox to disable the ability to share the local drive with the remote system.</td>
</tr>
<tr>
<td>Force read-only connections</td>
<td>Select to prevent the remote drive from writing to your local drive. Selected by default. <strong>Warning:</strong> Clearing the Force read-only connections check box may result in file system errors and data corruption because of drive caching when data is written back to the Redirected local drive.</td>
</tr>
</tbody>
</table>
Virtual Media Options

The operating system on the target computer must have a USB mass storage driver installed in order to use Virtual Media. As the BIOS on some systems does not always support mass storage emulation on the USB interface, the system default is to disable USB mass storage unless an image is loaded. This option may be unselected to use.

1. Do one of the following:
   a. Click Save to save settings.
   b. Click Reset to Defaults to restore system defaults.
   c. Click Reset to restore original settings.

Image on Windows Share

In this section of the page, you can enable the Spider device to access a CD-ROM image up to 4.7 GB on a Windows shared folder via SAMBA. The Spider device then makes that image accessible to the target computer by emulating a USB disk drive.

Note: Windows 2003 and Windows Vista do not support this feature.

Appropriate administrative permissions to access the host and file are needed, as well as the ability to see that computer over the network from the Spider device.

The connection remains mounted until the current user logs out or the Spider device is rebooted. Other client systems logging into the Spider device will see the active image in all Virtual Media pages.

To share a CD-ROM image, perform the following steps.

1. Enter the following: fields.

2. Do one of the following:
   a. To discard your changes, click Reset.
b. To mount the image, click **Set**. Information about the image displays in the **Virtual Media Active Image** section of the page and the CD icon displays on the remote console.

**Figure 7-8 Virtual Media Active Page**

3. If desired, in the **Virtual Media Active Image** section:
   a. Click **Reactivate** if the remote console does not recognize the image.
   b. Click **Unset** to remove the current image file. This option is available only when a user uploads a floppy image.
   c. Click **Download** to save the image file.

**Floppy Image**

In the **Floppy Image Upload** section, you can upload a floppy disk image to the Spider device, which then appears to the attached computer as a physical floppy drive. The desired floppy image file will be uploaded from the client system or from a network drive accessible to the client system. The file must be structured as a floppy image. To make a floppy image, search for and use a utility such as `dd` or `rawwrite`. The maximum image size is 1.44 MB. For larger images, use the CD-ROM Image function.

The image file remains in Spider device until the current user logs out, or the device is rebooted. Other client systems logging into the Spider device will also see the active image in all Virtual Media pages.

To upload a floppy image file, perform the following steps.

1. In the **Floppy Image Upload** section (bottom right), click **Browse** to locate the floppy image file.

2. Do one of the following:
   a. Click **Reset** to discard your changes.
b. Click **Upload** to load the image into Spider device’s memory. This floppy drive is accessible to the remote computer as a letter-name floppy drive (e.g., B:). Information about the image displays in the **Virtual Media Active Image** section of the page.

**Figure 7-9 Virtual Media Active Image**

3. If desired, in the **Virtual Media Active Image** section:
   
   a. Click **Reactivate** if the remote machine does not recognize the image.
   
   b. Click **Download** to save the image file.
   
   c. Click **Discard** to remove the current image file.

**Connecting to a Redirected Drive**

If Drive Redirection is enabled, you can connect to the drive. Depending on the combination of the type of drive and the Force read-only connections setting, different warnings display.

To connect to a redirected drive, perform the following steps.

1. Click the KVM Console button at the top of the Spider device web page or click the console image that you see when you log in to the Spider device. The Remote Console displays?

2. Click the disk icon  in the toolbar. Drive Redirection buttons display at the top left of the page.
Figure 7-10 Drive Redirection Window

3. Click the Connect Drive button at the top of the page. The Select a drive to redirect dialog box opens.

Figure 7-11 Drive Redirect Buttons

3. Click the Connect Drive button at the top of the page. The Select a drive to redirect dialog box opens.

Figure 7-12 Select Drive Redirect Window

4. From the drop-down list, select the drive you want to redirect.

Note: To refresh the list after adding or removing a drive, click the Refresh List button.

5. If desired, select the Enable Write support check box.

6. Click OK. Depending on your selections, the following events or warnings display:

7. If you select Enable Write support, the following warning displays:

Figure 7-13 Enable Write Support Window

Because of the danger of destroying all data on the drive, click Yes only if you are certain of what you are doing. If you select the hard disk from the drop-down list, the following warning may display:
8. Select the ISO image file to use as a local disk and press **Open**.

9. ISO Drive Redirection established displays at top of screen.

**User Interface Settings**

The color of page tabs on the Spider device can be changed. On the Interfaces page click **UI**. Select a style sheet from the drop-down list on the **User Interface Settings** page. Click **Save**.
8: User Accounts

This chapter describes user accounts including local and remote authentication, management, and user groups and how to configure each. It contains the following sections:

- Local vs. Remote Authentication
- Local User Management
- User Permissions
- Remote Authentication

Local vs. Remote Authentication

User names and groups may be administered on the Spider device to allow varying levels of access and control to different classes of users. To log in to the Spider device, a user must be authenticated by means of a password. This authentication may take place locally, where the user name and associated password are stored in the Spider device’s memory. The Spider device may query a centralized database using RADIUS or LDAP to determine if a given user may log in. In both of these cases, the user name must be defined on the Spider device where it has its permissions assigned.

Local User Management

A newly assigned user has permissions inherited from an assigned group. All Local Users not associated with a group will inherit default settings.

Modifying Passwords

To change current user password, perform the following steps.

2. Enter the current password under **Old Password**.
3. Enter the new password under **New Password** and **Confirm New Password**.
4. Click **Save** to save your settings, or click **Reset** to restore original settings.

**User and Group Management**

You must be logged in under a user name that has permissions for User/Group Management to access this page. The Spider device supports a maximum of 50 configured users. When defining a user, make sure the group to which the user will belong has already been created.

To configure users and groups, perform the following steps.

1. Click **User Account > User/Group**. The User/Group Management page displays.
User Management

To configure a user, perform the following steps.

1. Configure the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Existing users</td>
<td>To modify or copy an existing user, select that user from the drop-down menu and click Lookup.</td>
</tr>
<tr>
<td>New user name</td>
<td>Enter the new user’s name. Minimum 1 character.</td>
</tr>
<tr>
<td>Full user name</td>
<td>Enter the full name of the configured user. Minimum 1 character.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password for the user. Minimum 4 characters.</td>
</tr>
<tr>
<td>Confirm Password</td>
<td>Re-enter the password for the user.</td>
</tr>
<tr>
<td>Email address</td>
<td>(Optional) Enter the user’s email address.</td>
</tr>
<tr>
<td>Mobile number</td>
<td>(Optional) Enter the user’s mobile phone number.</td>
</tr>
<tr>
<td>Group Membership</td>
<td>Select the user’s group from the drop-down menu.</td>
</tr>
<tr>
<td>Enforce user to change password on next login</td>
<td>Select checkbox to require the user to change the password upon initial login.</td>
</tr>
</tbody>
</table>

2. Do one of the following:
   a. Click Create to add the new user.
   b. Click Modify to change an existing user.
   c. Click Copy to create a new user based on the selected existing user.
   d. Click Delete to delete an existing user.
   e. Click Reset to restore original settings.
**Group Management**

To configure a user group, perform the following steps.

1. Configure the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Existing Groups</strong></td>
<td>To copy or modify a group, select the group from the drop-down menu. Click Lookup.</td>
</tr>
<tr>
<td><strong>New Group Name</strong></td>
<td>Enter the new group’s name.</td>
</tr>
</tbody>
</table>

2. Do one of the following:
   a. Click **Create** to add the new group.
   b. Click **Modify** to change an existing group.
   c. Click **Copy** to create a new group based on the selected existing group.
   d. Click **Delete** to delete an existing group.
   e. Click **Reset** to restore original settings.

**User Permissions**

To modify user permissions, perform the following steps.

1. Click **User Accounts > Permissions**. The User/Group Permissions page displays.

2. From the drop-down menu, select **Group** to configure:

3. If you created a user belonging to a group, and you want to change permissions for the group, select **Group**.
4. If you created a user who does not belong to any group, then select **User**.

5. From the **Direct KVM** drop-down menu, do one of the following:
   a. Select **Yes** to enable the user or group to access the Remote Console only. After a user is authenticated, it launches the Java KVM console program.
   b. Select **No** (default) to display the web page after logon.

*Note:* Setting **Yes** may overwrite some selected permissions selected in step 4.

6. Modify the displayed permissions as necessary for the selection.

7. Do one of the following:
   a. Click **Save** to save settings.
   b. Click **Reset to Defaults** to restore system defaults.
   c. Click **Reset** to restore original settings.

**Remote Authentication**

If the authentication settings have been set to Local Authentication (the default), the Spider device uses its own database to perform authentication. If one of the remote authentication protocols is selected, the Spider device communicates with a remote server to authenticate user passwords.

To configure authentication settings, perform the following steps.

1. Click **User Accounts > Authentication**. The Authentication Settings page displays.
2. Modify the following field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local Authentication</td>
<td>When Local Authentication is selected, the Spider device will authenticate against its internal database of users and passwords, as described in Local User Management.</td>
</tr>
</tbody>
</table>

**LDAP**

When you select LDAP Authentication, the Spider device will communicate with a Microsoft Active Directory or generic LDAP server for user authentication. The user profile must be set up in the local database as described in Local User Management, but no password is stored locally. When a user attempts to log in, the Spider device contacts the specified LDAP server, which either approves or denies access.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDAP Server IP</td>
<td>Enter the name or IP address of the LDAP server, reachable over the network by the Spider device, containing the user database. Be sure to configure a DNS server if a name rather than address is used.</td>
</tr>
<tr>
<td>LDAP Server Base DN</td>
<td>Specify the Distinguished Name (DN) where the directory tree starts in the user LDAP server.</td>
</tr>
<tr>
<td>LDAP Server Type</td>
<td>Select the type of the external LDAP server. Available selections are Generic LDAP and Microsoft Active Directory. If a Generic LDAP Server is selected, edit the LDAP scheme.</td>
</tr>
<tr>
<td>User Search Sub-filter</td>
<td>Select to restrict the search for users by adding an additional search filter to each query for a user.</td>
</tr>
</tbody>
</table>
RADIUS

When RADIUS is selected, the Spider device communicates with a RADIUS server for user authentication. To access a Spider device set up for RADIUS, log in with a name and password. The Spider device contacts the RADIUS server for authentication and, if approved, the Spider device uses the locally stored user profile. If there is no such profile, access via RADIUS will be refused.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bind Name</td>
<td>The name for a non-anonymous bind to an LDAP server. This item has the same format as LDAP Base. One example is cn=administrator,cn=Users,dc=domain,dc=com.</td>
</tr>
<tr>
<td>Bind Password and Confirm Password</td>
<td>Password for a non-anonymous bind. This entry is optional. Acceptable characters are a-z, A-Z, and 0-9. The maximum length is 127 characters.</td>
</tr>
</tbody>
</table>

1. Do one of the following:
   a. Click **Save** to save settings.
   b. Click **Reset to Defaults** to restore system defaults.
   c. Click **Reset** to restore original settings.
9: Services

This chapter describes the Spider and SpiderDuo KVM-over-IP services. It contains the following sections:

- Date/Time
- Security
- Certificate
- Event Log
- SNMP
- KVM Search
- Power Management

Date/Time

The Spider device contains an internal real time clock that maintains a basic date and time after being set. The clock, however, will reset if the unit loses power. If an accurate date and time are critical, the Spider device supports synchronization with Network Time Protocol servers. Internally, the date and time are only used to timestamp events in the log and for the inactivity timeout.

To configure the date and time settings, perform the following steps.

1. Click Services > Date/Time. The Date/Time Settings page displays.
2. Modify the following fields.

**Table 9-2 Date/Time Settings**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UTC Offset</td>
<td>Time servers deliver time as Coordinated Universal Time (UTC, or Greenwich Mean Time). Select the appropriate offset in hours ± from the drop-down menu.</td>
</tr>
<tr>
<td>User Specified Time</td>
<td>Manually input the current date and time. The Spider device keeps time as long as power is applied. It has an internal calendar, but does not know about daylight savings time and requires resetting twice a year. The internal clock accuracy is ±30 ppm.</td>
</tr>
<tr>
<td>Synchronize with NTP Server</td>
<td>Enter a primary and secondary time server in the respective fields. Ensure NAT and firewalls are set up to allow the protocol to pass. Also, provide the Spider device with DNS server names.</td>
</tr>
</tbody>
</table>

3. Do one of the following:
   a. Click **Save** to save settings.
   b. Click **Reset to Defaults** to restore system defaults.
   c. Click **Reset** to restore original settings.

**Security**

General settings for security parameters such as encryption and access control are at **Services > Security**. Other areas with security implications include User Management/Permissions, Authentication, Network Settings, and the Event Log; see the appropriate sections for information on those areas.

To modify security settings, perform the following steps.

1. Click **Services > Security**. The **Security** page displays.
2. Modify the following fields.

**HTTP Encryption**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Force HTTPS for Web Access</td>
<td>Typically, the Spider device listens on both HTTP and HTTPS ports for incoming connections. If this box is checked, access can only be made using SSL, and connection requests on the HTTP port will be ignored. See the section on Certificate for further information on how the Spider device identifies itself using a cryptographic certificate.</td>
</tr>
</tbody>
</table>

**Login Limitations**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Single Login Limitation</td>
<td>If this box is checked, each username may only have one logged in connection at a time. If unchecked, multiple instances of username logins are allowed.</td>
</tr>
</tbody>
</table>

**KVM Encryption**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KVM Encryption</td>
<td>In addition to the SSL encryption of the Spider device's web pages, the keyboard, mouse, and video data may be encrypted. Select Off to use no encryption. Select Try for the Spider device to attempt to make an encrypted connection but will back off to unencrypted if one cannot be established. Select Force for an encrypted connection to be made, or an error will be reported.</td>
</tr>
</tbody>
</table>
3. Do one of the following:
   a. Click **Save** to save settings.
   b. Click **Reset to Defaults** to restore system defaults.
   c. Click **Reset** to restore original settings.
Certificate

The Spider device uses the Secure Socket Layer (SSL) protocol for any encrypted network traffic between itself and a connected client. During the connection establishment the Spider device has to expose its identity to a client using a cryptographic certificate. Upon leaving the factory this certificate and the underlying secret key is the same for all Spider devices and will not match the network configuration where it is installed. The certificate’s underlying secret key is also used for securing the SSL handshake. Leaving the default certificate unmodified is all right in most circumstances and is necessary only if the network facility is vulnerable to man-in-the-middle attack.

It is possible to generate and install a new base64 x.509 certificate that is unique for a particular Spider device. The Spider device is able to generate a new cryptographic key and the associated Certificate Signing Request (CSR) that needs to be certified by a certification authority (CA).

To create and install an SSL certificate, perform the following steps.

1. Click **Services > Certificate**. The Certificate Signing Request page displays.

![Certificate Signing Request Page](image)

2. Modify the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Common name</td>
<td>The network name of the Spider device once it is installed in the user's network (usually the fully qualified domain name). It is identical to the name that is used to access the Spider device with a web browser without the prefix http://. In case the name given here and the actual network name differ, the browser will pop up a security warning when the Spider device is accessed using HTTPS.</td>
</tr>
<tr>
<td>Organizational unit</td>
<td>This field specifies to the department within an organization to which the Spider device belongs.</td>
</tr>
<tr>
<td>Organization</td>
<td>The name of the organization to which the Spider device belongs.</td>
</tr>
<tr>
<td>Locality/City</td>
<td>The city where the organization is located.</td>
</tr>
</tbody>
</table>
3. Click **Create** to initiate the Certificate Signing Request generation. Download the CSR by clicking **Download**. The **Download** button displays when a certificate is created. Send the saved CSR to a CA for certification.

4. Click **Upload** to upload the certificate from the client computer to the Spider device. The Spider device now has its own certificate used for identifying itself to its clients.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State/Province</td>
<td>The state or province where the organization is located.</td>
</tr>
<tr>
<td>Country (ISO code)</td>
<td>The country where the organization is located. This is the two-letter ISO code (e.g., US for the United States).</td>
</tr>
<tr>
<td>Email</td>
<td>The email address of a contact person responsible for the Spider device and its security.</td>
</tr>
<tr>
<td>Challenge password/Confirm Challenge password</td>
<td>Certain certification authorities require a challenge password to authorize later changes on the certificate (e.g., revocation of the certificate). The minimal length of this password is four characters.</td>
</tr>
<tr>
<td>Key length (bits)</td>
<td>Select the key length from the drop-down menu.</td>
</tr>
</tbody>
</table>
Event Log

The Event Log maintains a list of significant events locally. Alternatively, it can use an NFS log file, SMTP email, or SNMP to distribute event information on the network. The Spider device monitors five classes of events with the logging of each enabled or disabled.

To configure event log settings, perform the following steps.

1. Click **Services > Event Log**. The **Event Log** page displays.

2. Modify the following fields:

**Event Log Targets**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List Logging Enabled</td>
<td>Check this box to use the internal log list of the Spider device. The maximum number of entries is 1,000. Every entry that exceeds this limit overrides the oldest one. The number of log entries shown on each page may be changed in the text box. The internal log list is cleared when power is removed from the Spider device, or when you click the <strong>Clear</strong> button.</td>
</tr>
<tr>
<td>NFS Logging Enabled</td>
<td>The Spider device can write log information to a file on an NFS server. Provide the name of the server, share, and file in the boxes. The NFS share will be mounted immediately, and an error message will result if it cannot be found.</td>
</tr>
</tbody>
</table>
3. Do one of the following:
   a. Click Save to save settings.
   b. Click Reset to Defaults to restore system defaults.
   c. Click Reset to restore original settings.

### SNMP

The Spider device has an internal SNMP agent that has various objects accessible in its MIB. It also can generate traps based on events. The Spider device permits enabling or disabling the SNMP agent, input read and write communities, location information, contact information, and viewing the MIB.

To configure SNMP settings, perform the following steps.

1. Click Services > SNMP. The SNMP Settings page displays.
2. Modify the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable SNMP Agent</td>
<td>Click the checkbox to enable the Spider device SNMP agent, and enter the system location and the contact name for the system.</td>
</tr>
<tr>
<td>Use SNMPv3</td>
<td>Select to use SNMPv3 (rather than SNMPv1) and enter the following:</td>
</tr>
<tr>
<td>Use SNMPv1</td>
<td>Select to use SNMPv1 (rather than SNMPv3) and enter the following:</td>
</tr>
</tbody>
</table>

- **DES Encryption**: Select whether to turn off or enable encryption with Data Encryption Standard (DES).
- **Read Username**: User ID for a user with read-only authority to use to access SNMP v3.
- **Read Password**: Password for a user with read-only authority to use to access SNMP v3. Up to 32 characters.
- **Write Username**: Enter a user ID for users with read-write authority. Up to 32 characters.
- **Write Password**: Enter a password for the user with read-write authority to use to access SNMP v3. Up to 20 characters.

3. Do one of the following:
   a. Click **Save** to save settings.
   b. Click **Reset to Defaults** to restore system defaults.
   c. Click **Reset** to restore original settings.
KVM Search

The KVM Search option enables you to view the properties of other Spider devices on the network. The following items display:

- IP address
- Hostname
- Direct KVM
- Preview
- Terminal
- SSH
- Telnet
- MAC Address
- Model
- Version
- Description

Note: The information shown on the web interface represents a snapshot in time. To see the most recent data, click Refresh.

To view a KVM search, perform the following steps.

1. Click Services > KVM Search. The search results display.
Power Management

The Power Management option enables you to manage the properties of the power system. It enables the monitoring of the Power Control Unit (PCU) that only applies to the SpiderDuo, and the sending of Wake-On-LAN (WOL) messages to a computer that has WOL enabled.

To view the Power Management page, perform the following steps.

1. Click Services > Power Management. The Power Management page displays.
The Power Management web page contains two sections as displayed in Figure 9-8. The upper portion displays information about the SpiderDuo PCU. The PCU only applies to the SpiderDuo. The WOL applies to both the Spider and SpiderDuo devices.

**SpiderDuo Power Control Unit**

The SpiderDuo Power Control Unit section of the web page contains the power and PCU status. You can also enable or disable the PCU which requires a reboot.

To enable the PCU, perform the following steps.

1. Click **Enable**. A warning displays requesting that you confirm.
2. Click **Confirm Enable**. The message that the enable was successful.
3. Reboot for the change to take effect.

**Wake-On LAN**

Wake-On-LAN (WOL, sometimes WoL) is an Ethernet computer networking standard that allows a computer to be turned on or woken up remotely by a network message sent usually by a program executed on another computer on the network.

The WOL requests get generated and sent to a single machine or group of devices. If a single machine is selected (via the first radio button), the MAC address for the selected device must be supplied. If no password is needed, the password field maybe left blank.
If the second radio button is selected, the WOL message may be sent to any number of devices identified by a Device Name, IP Address (optional), or MAC address (entered into the respective text boxes). If no password is needed, this field should be left blank.

WOL support is implemented on the motherboard of a computer and the network interface and is not dependent on the operating system running on the hardware, although the operating system can sometimes control the WOL behavior. Refer to your motherboard and operating system user guide for configuration information.

**Enable WOL**
To enable WOL, perform the following steps.

1. Enter the MAC address and password in the **Send to the MAC address below** field.
2. Click **Wake Up**.
   Or
2. Enter the device name, IP address, MAC address, and password in the **Send to the following devices** field.
3. Click **Add More Entries** if required. Repeat Step 2 for each additional entry.
4. Click **Wake Up**.

**Remove Entries, Reset to Defaults, or Reset**
To remove an entry from the **Send to the following devices** table, clear the **Device Name** field and click **Save**.
To reset to defaults, click **Reset to Defaults**.
To reset, click **Reset**.
10: Maintenance

This chapter describes various maintenance activities of an administrator. These include viewing status, backing up and restoring configuration files, updating firmware, viewing the event log, and resetting the unit. It contains the following sections:

- Device Status
- Configuration
- Update Firmware
- View Event Log
- Unit Reset
- iGoogle Gadgets

Device Status

The Device Status page contains a table with information about the Spider device’s hardware and firmware. This information is useful if technical support is required.

To view device information, perform the following steps.

1. Click Maintenance > Device Status. The Device Status page displays.

Figure 10-1 Device Status Page
2. View or modify the following fields.

**Table 10-2 Device Status Settings**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device Information</td>
<td>Displays the product name, serial number, board ID, device IP address, device MAC address, firmware version, firmware build number, firmware description, hardware, and Kira chip revision.</td>
</tr>
<tr>
<td>Connected Users</td>
<td>Displays the user name and IP address of the active connection. It also displays whether the user is connected to the Remote Console, and if so, whether exclusive access mode is activated.</td>
</tr>
<tr>
<td>System Identifier</td>
<td>Check the box to turn the ID indicator on and off. Each Spider device has an orange LED that can be lit by remote control. By default the LED is off, and when you clear the checkbox, the LED gets turned on.</td>
</tr>
<tr>
<td>USB Status</td>
<td>Displays the USB speed, keyboard, mouse, and mass storage status.</td>
</tr>
</tbody>
</table>

3. Do one of the following:
   a. Click **Save** to save settings.
   b. Click **Reset to Defaults** to restore system defaults.
   c. Click **Reset** to restore original settings.

**Configuration**

In the Configuration page, you can specify the backup, preserve Network Basic settings, and restore the computer or Spider device configuration.

To view the configuration parameters, perform the following steps.

1. Click **Maintenance > Config/Factory Defaults**. The following page displays.
2. Edit the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Configuration Backup          | To back up all settings to a file on the client system, click the **Backup and save to your computer** radio button. To save to a Spider device, click the **Backup and save to Spider device** radio button. Then, click **Backup**.  
  **Warning:** *Execution of the Backup and save to Spider device option overwrites the backup file.* |
| Configuration Restore         | To return the Spider device settings to a previously saved configuration:  
  ✦ Click the **Restore from Config File on Spider device** radio button or **Upload and restore from config file saved on your computer** radio button. You can then browse to and select the saved configuration file.  
  ✦ In the **Preserve Following Settings: field**, click **Network Basic**. Click the Network Basic checkbox to preserve the current network basic settings on the Network Settings page and import only the remaining settings from the configuration file.  
  ✦ Click the **Upload** button. If you select this option, the Spider device reboots after you apply the update.  
  **Warning:** *Execution of Upload function overwrites the current configuration settings with the selected configuration file settings and reboots the host.* |
| Factory Defaults              | To preserve the factory defaults, click the **Network Basic** checkbox. Then click the **Restore** button.  
  **Warning:** *Execution of this option restores the current configuration settings to the factory default settings and reboots the host.* |
Update Firmware

Many of the functions and features of the Spider device are implemented in firmware and capable of field upgrades. The latest firmware may be found at www.lantronix.com. The firmware file, when uncompressed, is approximately 4 Mbytes in size and has a .bin suffix.

Upon updating firmware, the Spider device resets itself. After the reset, the login page displays (if not, manually return to the login page).

To update Spider device firmware, perform the following steps.
1. Download the firmware file to the client system local drive or an accessible network drive.
2. Click Maintenance > Update Firmware. The Firmware Update page displays.

3. Click Browse. In the pop-up window, navigate and locate the firmware file.
4. Click Upload to copy the file into the Spider device’s local memory. When uploaded correctly, the Firmware Upload window displays the version number of the new firmware. Click the Update button to replace the old with the new, or to cancel the operation, click the Discard button. Do not interrupt power to the Spider device during the update process.

View Event Log

To view the current event log, perform the following steps.
1. Click Maintenance > Event Log. The Event Log page displays.
2. Navigate between logs by clicking **Prev** and **Next**.

**Unit Reset**

In general, the Spider device requires a reset when implementing a firmware update. In the event of an abnormal operation, a number of subsystems may be reset without resetting the entire Spider device.

To reset the Spider device, perform the following steps.

1. Log into the Spider device as **sysadmin**.
2. Click **Maintenance > Unit Reset**. The following page displays.
3. Click the **Reset** button for **Reset Keyboard/Mouse (PS/2)**, **Reset USB**, or **Reset Video Engine** to clear and reset the subsystem. Resetting subsystems does not terminate connected users.

   **Note:** Reset **USB** displays only on the **SpiderDuo device**.

4. To perform a complete reset, click **Reset Device**. A prompt requesting confirmation displays. A complete reset closes all user connections and performs a full reboot.

### iGoogle Gadgets

You can create an iGoogle gadget that enables you to view and access multiple Spider devices on one web page. You access a snapshot of each of the Spider device's Remote Console without logging in to the Spider device.

Technically, the number of Spider devices that can be viewed and accessed on one web page is unlimited. It is important to note that the more Spider devices that are added, the slower the response time will be.

Anyone with a Google email account (gmail.com) can create an iGoogle gadget for viewing web pages. There are two types of iGoogle gadgets: public gadgets and private gadgets. When you submit a gadget’s XML code to Google, it becomes part of the iGoogle public gadgets, which are listed for import on iGoogle web pages. When a gadget’s XML code is stored on a private server, the gadget stays private and is usable only by users who are aware of its location.

To use iGoogle gadget to manage multiple Spider devices, perform the following steps.

1. Click **Services > Security**.

2. In the Authentication Limitation section, select the **Enable Screenshot Access without Authentication** check box.
3. Edit a file similar to the example below and save it with extension "xml." This example assumes the file is saved as spider1.xml. The sample code displays a snapshot and refreshes the image every minute. Also, clicking the snapshot opens the remote console program or spider web page, depending on your settings.

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<Module>
    <ModulePrefs title="Spider device Preview (Your Spider device IP Address)" height="240" scaling="false" />
    <![CDATA[
        <center>
            <div id="sp_img">
                <img src="http://(your Spider device IP address)/screenshot.jpg" border="0" width="320" height="240" onclick="window.open('https://(your Spider device IP address)/');" />
                <script>
                    var c = 0
                    var t
                    function updateSpiderSnapshot()
                    {
                        document.getElementById('sp_img').src = "http://(your Spider device IP address)/screenshot.jpg?rnum=" + c;
                        c = c + 1
                        t = setTimeout("updateSpiderSnapshot()",& 60000) // 60 sec
                    }
                    updateSpiderSnapshot();
                </script>
            </div>
        </center>
    ]]>
    </Content>
</Module>
```

4. Upload the edited xml file (spider1.xml) to a web server that is accessible over the Internet.

5. Enter the URL http://www.google.com/ig.

6. Log in to your iGoogle account.

7. Click Add Stuff.

8. Click Add feed or gadget.

9. Enter http://(your internet web server IP address)/spider1.xml and click Add.

10. In response to a Google pop-up a warning, click OK.

11. Click Back to homepage. You should see an iGoogle gadget similar to Figure 10-7.
Figure 10-7  iGoogle Gadget Page
11: Command Reference

This chapter lists and describes the command line interface (CLI) syntax and contains the following sections:

- Command Syntax
- Configuration Commands
- Connect Commands
- User Commands
- User Group Commands
- OEM Customization Commands
- Power Commands
- Serial Port Commands
- WOL (Wake on LAN) Commands
- USB Host Disk Commands
- Reboot Commands
- Diagnostic Commands
- Group Permissions

Command Syntax

Commands have the following format: `<action> <category> <parameter(s)>` where `<action>` is set, show, connect, diag, admin, or logout. `<category>` is a group of related parameters you want to configure or view. Examples are device, group, user, and network. `<parameter(s)>` is one or more name-value pairs in one of the following formats:

- `<parameter name> <aa | bb>`—Specify one of the values (aa or bb) separated by a vertical line ( | ). The values are all lowercase and must be entered exactly as shown. Bold indicates a default value.
- `<parameter name> <Value>`—Specify an appropriate value, for example, a device group name. This User Guide shows parameter values in mixed case to indicate they are case sensitive. For example, if you saved a device group name in mixed case, you must enter it in mixed case; if you saved it in lowercase, you must enter it in lowercase.
- Square brackets [ ]—Indicate optional parameters.

Table 11-1  Action and Category

<table>
<thead>
<tr>
<th>Action</th>
<th>Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>set</td>
<td>datetime</td>
</tr>
<tr>
<td>show</td>
<td>datetime</td>
</tr>
<tr>
<td>connect</td>
<td>serial</td>
</tr>
<tr>
<td>diag</td>
<td>ping</td>
</tr>
</tbody>
</table>
Command Help
For general command help, type: help
For more information about a specific command, type help followed by the command, for example:
help set network
OR
type ? after the command:
set network ?

Tips
Type enough characters to identify the action, category, or parameter name uniquely. For parameter values, type the entire value. For example, set network port 1 state static ipaddr 122.3.10.1 mask 255.255.0.0 can be shortened to set net po 1 st static ip 122.3.10.1 ma 255.255.0.0.

Use the Tab key to automatically complete action, category, or parameter names. Type a partial name and press Tab to complete the name if only one is possible, or to display the possible names if more than one is possible.

Should you make a mistake while typing, backspace by pressing the Backspace key or the Delete key, depending on how you accessed the interface. Both keys work if you use VT100 emulation in your terminal access program when connecting to the console port. Use the left and right arrow keys to move within a command.

Use the up and down arrows to scroll through previously entered commands. If desired, select one and edit it. You can scroll through up to 100 previous commands entered in the session.

When the number of lines displayed by a command exceeds the size of the window (the default is 20), the "Type more to see the next page" message displays. To display the next page, type more and press Enter. You can override the number of lines (or disable the feature altogether) with the set cli command.

To clear an IP address, type 0.0.0.0.

Configuration Commands
admin config

Syntax
admin config factorydefaults [preserveconfig <Config Params to Preserve>]

Table 11-1  Action and Category (continued)
Parameters

<Config Params to Preserve> is a comma separated list of current configuration parameters to retain after the config restore or factorydefaults: nt - Network Basic vp.

Description

Restores the Spider configuration and device database settings to factory defaults.

Note: The unit reboots after this command. All current settings are lost.

admin config show

Syntax

admin config show

Parameters

None

Description

Shows the current configuration.

admin config save

Syntax

admin config save

Parameters

None

Description

Saves the current configuration.

Note: Each time you use the admin config save command, the existing “config_save” file is overwritten.

admin config restore

Syntax

admin config restore

Parameters

None

Description

Restores a saved configuration.

Note: A reboot automatically occurs after this command.
Connect Commands

connect serial

Syntax
connect serial

Description
Connects the Spider device to a device serial port.

Note: To connect to a serial port, put the serial port in passthrough mode on the web interface.

ESC exit

Syntax
ESC exit

Description
Available only when connected to a serial port.

SSH Key Commands

set sshkey delete

Syntax
set sshkey delete keyuser <SSH Key User> keyhost <SSH Key Host>

Description
Deletes an imported SSH key.

Examples
To delete an imported SSH public key on host -pipe for the sysadmin user, enter the following CLI:
set sshkey delete keyuser sysadmin keyhost -pipe

set sshkey import

Syntax
set sshkey import <copypaste> format <openssl> keyuser <SSH Key User> keyhost <SSH Key Host>

Description
Imports public SSH key (OpenSSH format)

Examples
To import a public key in OpenSSL format on host -pipe for the sysadmin user, enter the following CLI:
set sshkey import copypaste format openssl keyuser sysadmin keyhost -pipe

Note: RSA keys must be 1024 bits
show sshkey import

Syntax
show sshkey import <one or more parameters>

Parameters
[keyuser <SSH Key User>]
[keyhost <SSH Key IP Address or Name>]
[viewkey <enable|disable>]

Description
Displays imported SSH keys.

Examples
To display all imported SSH public keys with content of keys, enter the following CLI:
show sshkey viewkey enable

To displays an imported SSH public key on host -pipe for the sysadmin user, enter the following CLI:
show sshkey keyuser sysadmin keyhost -pipe

History Commands

set history clear

Syntax
set history clear

Description
Clears the CLI command history.

show history

Syntax
show history

Description
Displays the 100 most recent CLI commands.

Network Commands

set network gateway

Note: The set network gateway command is deprecated with this release. See set network basic.

set network

Syntax
set network basic <parameters>
Parameters

dns1 <IP Address>
dns2 <IP Address>
gateway <IP Address>
hostname <Host Name>
ipaddr <IP Address>
ipv6 <enable/disable>
ipv6addr <IPv6 Address/Prefix>
mask <Mask>
state <dhcp|bootp|static>

**Note:** To clear IPV4 addresses, set ipv4 address to “0.0.0.0”. To clear IPV6 address, set ipv6 address to “::” or “::/128”.

set network misc

**Syntax**

set network misc <parameters>

**Parameters**

bwlimit <8-10000 kbit/s>
httpsports <TCP Port>
httpport <TCP Port>
proxy <enable/disable>
proxyhost <IP Address>
proxyport <TCP Port>
telnet <enable/disable>
telnetport <TCP Port>
setu@protocol <enable/disable>
ssh <enable/disable>
sshport <TCP Port>

**Description**

Sets miscellaneous network parameters.

set network interface

**Syntax**

set network interface <parameters>

**Parameters**

mode <auto|10mbit-half|100mbit-half|10mbit-full|100mbit-full>

**Description**

Sets network interface modes.

show network all

**Syntax**

show network all

**Description**

Displays all network settings.
show network basic

Syntax
show network basic

Description
Displays basic network parameters.

show network misc

Syntax
show network misc

Description
Displays network miscellaneous parameters.

show network interface

Syntax
show network interface

Description
Displays network interfaces.

show network all

Syntax
show network all

Description
Displays all network settings.

Version Command

admin version

Syntax
admin version

Description
Displays firmware version information.

Date/Time Command

set datetime

Syntax
set datetime <one parameter>
Parameters

date <MMDDYYhhmm[ss]>
utcoffset <offset string>

Notes:

- **MMDDYYhhmm[ss] can be:**
  - MM is 1-12
  - DD is 1-31
  - YY is 00-99
  - hh is 0-23
  - mm is 0-59
  - ss is 0-59

- **Offset string can be:**
  - -11h, -10h, -9h, -8h, -7h, -6h, -5h, -4h, -3h, -2h, -1h
  - +/-0h, +1h, +2h, +3h, +4h, +5h, +6h, +7h, +8h, +9h, +10h, +11h, +12h

Note:  Select only one offset as shown above.

Description

Sets the date and time or UTC offset.

show datetime

Syntax

show datetime

Description

Shows the date/time and UTC offset.

User Commands

set user

Syntax

set user add|edit <User Login> [parameters]

Parameters

[<email <Email Address>]]
[<fullname <Full Name>]]
[<group <Group Name|default|Admin|None>]]
[<mobile <Phone Number>]]

Note:  The group 'default' (Unknown) and 'Admin' and are built-in groups. The group 'None' indicates that user is created without defining a group, and permissions will be assigned specifically to the user. A user will be assigned 'default' group by omitting group parameter when creating a new user.
Description
Sets user login, email address, group, and mobile phone number.

set user delete

Syntax
set user delete <User Login>

Description
Deletes a user login.

set user password

Syntax
set user password <User Login>

Description
Sets user password.

show user name

Syntax
show user name [user <User Login>]

Description
Displays user names.

show user

Syntax
show user [index <Index Number>]

Description
Displays index numbers.

User Group Commands

set group

Syntax
set group add|edit <Group Name> [parameters>

Parameters
permissions <Permission List>

Description
Configures user groups. See Group Permissions on page 118 for information about permissions.
set group delete

Syntax
set group delete <Group Name>

Description
Deletes user groups.

show group name

Syntax
show group [name <Group Name>]

Description
Displays group names.

show group index

Syntax
show group [index <Index Number>]

Description
Displays group indexes.

Note: [Group of 'None (username)'] indicates that user was created without defining a group, and permissions will be assigned specifically to the user. In order to specify a group of this type "None", use '@username' as the name parameter.

Security Commands

set security

Syntax
set security <one or more parameters>

Parameters
[forcehttps <enable|disable>]
[singlelogin <enable|disable>]
[kvmencryption <off/try/force>]
[screenshot <enable|disable>]
[directkvm <enable|disable>]

Description
Sets security parameters.

show security

Syntax
show security
Description
Displays security parameters.

Sysconfig Commands

**show sysconfig**

**Syntax**
show sysconfig

**Description**
Displays a report of parameters with firmware version, serial number, basic network settings, security settings, user/group information, and basic system settings.

Device Commands

**set device**

**Syntax**
set device add | edit <Device Name> macaddress <MAC Address> [parameters]

**Parameters**
ipaddress <IP Address>
password <Password>

**Note:** MAC address must be in hex form: XX:XX:XX:XX:XX:XX.

**Description**
Configures devices.

**set device delete**

**Syntax**
set device delete <Device Name>

**Description**
Deletes a device.

**show device**

**Syntax**
show device

**Description**
Displays devices.

**show device all**

**Syntax**
show device all
**Description**
Displays all devices.

**show device name**

**Syntax**
show device name

**Description**
Displays device names.

---

**OEM Customization Commands**

**set oem**

**Syntax**
set oem <one or more parameters>

**Parameters**
[product <Product Name>]
[company <Company Name>]
[copyright <Copyright>]
[url <URL>]
[title <Title>]

**Examples**
To set the product name as MyKVM and the company name as MyCompany, enter the following CLI:

```
set oem product MyKVM company MyCompany
```

**Description**
Sets product/company specific information on the web interface.

**show oem**

**Syntax**
show oem

**Description**
Displays OEM settings.

---

**Power Commands**

**set power <parameters>**

**Syntax**
set power <parameters>
Parameters
[state <on/off>]

Description
Sets PCU parameters.

show power

Syntax
show power

Description
Displays PCU status and settings.

Serial Port Commands

set serial mode

Syntax
set serial mode passthrough | config [<parameters>]

Parameters
[baud <300-115200>]
[databits <7|8>]
[stopbits <1|2>]
[parity <none|odd|even>]
[flowcontrol <none|xon/xoff|rts/cts>]

Description
Set serial port parameters for each mode.

show serial

Syntax
show serial

Description
Displays serial port settings.

WOL (Wake on LAN) Commands

connect wakeonlan device

Syntax
connect wakeonlan device [Device Name]
Description
Sends a WOL packet to a specified device.

```
connect wakeonlan macaddr
```

**Syntax**
```
connect wakeonlan macaddr [MAC Address] [password <Password>]
```

**Note:** MAC address must be in hex format: ‘XX:XX:XX:XX:XX:XX’

Description
Sends a WOL packet to specified MAC address.

**USB Host Disk Commands**

**Note:** The following USB Host Disk commands are available for the SpiderDuo device only.

```
usbdisk mount drive
```

**Syntax**
```
usbdisk mount drive
```

**Description**
Mounts a USB thumb drive to use as a storage device. The USB thumb drive must be formatted with an fat filesystem and drive must support USB high speed mode.

```
usbdisk unmount drive
```

**Syntax**
```
usbdisk unmount drive
```

**Description**
Unmounts the USB thumb drive.

```
usbdisk dir drive
```

**Syntax**
```
usbdisk dir drive
```

**Description**
Displays a directory listing of a USB thumb drive.

```
usbdisk dump
```

**Syntax**
```
usbdisk dump <Filename>
```
Description
Dumps the first 256 lines or 1M bytes of the specified file content of a USB thumb drive.

Reboot Commands

`admin reboot`

Syntax
`admin reboot`

Description
Immediately terminates all connections and reboots the device.

Diagnostic Commands

`diag ping`

Syntax
`diag ping <IPV4 Address> | ping6 <IPV6 Address>`

Description
Verifies if the Spider or SpiderDuo device can reach a host over the network.

Group Permissions

For group permissions, each user is a member of a group, and has a set of permissions associated with the group. The group permissions are defined by permissions parameters.

A `<Permission List>` is a comma-separated list of user rights to be added to or removed from the group current permissions. Precede the two-letter acronym with a `-` to remove a user right. For example, `'nt,dt,-ka'` adds Networking and Date/Time rights and removes KVM Console Access rights. See the following list:

- `br`: Board Reset
- `dk`: Direct KVM
- `dt`: Date/Time Settings
- `fc`: Firmware/Config Management
- `gp`: Group Permissions
- `ka`: KVM Console Access
- `ke`: KVM Settings(Encoding)
- `kx`: KVM Settings(Exclusive Access)
- `kh`: KVM Settings(Hotkeys)
- `km`: KVM Settings(Monitor Mode)
- kt: KVM Settings(Type/Deployment)
- ks: Keyboard/Mouse Settings
- ld: LDAP Settings
- ns: Network Settings
- pc: Change Password
- po: Power Control
- sn: SNMP Settings
- sa: SSH/Telnet Access
- sm: SSL Certificate Management
- sl: Security/Log/Authentication
- ss: Serial Settings
- us: USB Settings
- um: User/Group Management
- vs: Video Settings
- va: Video Settings(Advanced)
- vu: Virtual Media Upload
Appendix A: Troubleshooting

No connection can be established to the Spider device.

Check cabling. Are both USB cables or all of the USB and PS/2 cables plugged in? Are both Pwr LEDs lit? Is the Ethernet cable plugged in, and the Link light lit? Is there Activity?

Have a look on your network. Verify your network configuration (IP address, router). Send a ping request to the Spider device to find out whether the Spider device is reachable via the network. Establish a direct connection between the Spider device and the client. If you use a firewall then check the appropriate port for accepting connections. The TCP ports 80 (for HTTP) and 443 (for both HTTPS and RFB) have to be open (the server providing the firewall has to accept incoming TCP connections on these ports). You may restrict these connections to the IP addresses used by the Spider device and your client.

Login on the Spider device fails.

Verify both your user login and your password. By default, the user sysadmin has the password PASS. Ensure the web browser is configured to accept cookies.

The Remote Console window of the Spider device does not open.

A firewall may prevent access to the Remote Console (TCP port 443). If there is a proxy server between the Spider device and your host, then you may not be able to transfer the video data using RFB. Check the settings of the Spider device and choose a different server port used for RFB transfer. A Java Runtime Environment may not be installed, or may be disabled.

The video quality is bad or the picture is grainy.

Enter the Remote Console and click the Auto Adjust button to adjust the Spider device’s video input parameters to the correct values.

Special key combinations (e.g., ALT+F2, ALT+F3) are intercepted by the client system and not transmitted to the remote computer.

You have to define a Button Key. This can be done in the Remote Console settings. Alternatively, use the soft keyboard feature.

The Spider device web pages are not displayed correctly.

Check your browser’s cache settings. Ensure the cache settings are not set to “do not check for newer pages.” Otherwise the web pages may be loaded from your browser cache and not from the Spider device.

Every time I open a dialog box with some buttons, the mouse pointers are not synchronous anymore.

Disable the setting Automatically move mouse pointer to the default button of dialog boxes in the mouse settings of your operating system.

The Remote Console does not open with Opera in Linux.

Some versions of Opera do not grant enough permission if the signature of the applet cannot be verified. To solve the problem, add the lines grantcodeBase "nn.pp.rc.RemoteConsoleApplet" {permission java.lang.RuntimePermission "accessClassInPackage.sun.*"}; to the java policy file of opera (e.g., /usr/share/opera/java/opera.policy).
I forgot my password. How can I reset the Spider device to factory defaults?

Use the serial interface with a terminal emulator program set to 9600 or 115200, 8 bit characters, No parity, 1 Stop bit, and No flow control. Within 2 seconds of booting the Spider device, press the Esc key a few times to get a =>prompt. Type defaults at the => prompt.

If you can't get the => prompt after several tries at 9600, try 115200. Earlier firmware sets the serial console port to 115200 by default.

Cannot upload the signed SSL certificate in MacOS X.

If an “internal error” occurs while uploading the signed certificate either changes the extension of the file to .txt or adds a file helper using the Internet Explorer preferences for this type of file. Make sure that the encoding is set to “plain text” and the checkbox “use for outgoing” is set. As an alternative, you may also use a Mozilla based browser (Mozilla, FireFox).

If you cannot get into the BIOS of your system or you cannot boot your system using Virtual Media, try some of the following:

If you have a PS/2 model Spider device:

1. Under Interfaces:Keyboard/Mouse – Check the Force USB Full Speed Mode box.
2. Under Interfaces:Keyboard/Mouse – Set the Host Interface to PS/2
3. If your system only has USB and no PS/2, do the above and use a PS/2 to USB adapter

If you have a USB model Spider device, in Interfaces:Keyboard/Mouse, check the Force USB Full Speed Mode box.

If the key used to enter BIOS setup or the boot menu on your PC is intercepted by your client OS, add a Virtual Key under Interfaces:KVM Console Settings.
Appendix B: Virtual Media Example

Goal

In this example, the goal is to put a rescue CD (a CD used to boot a PC when the hard-disk corruption prevents OS boot) on PC#3 so that the rescue CD can be used by any Spider devices on the network.

Figure B-1 Virtual Media

In this example, PC#2 cannot boot from its hard disk, so the user wants to use the rescue CD to boot the PC. We assume PC#2 can boot from external USB device.

Step 1 – Prepare the VM Server

1. Use any CD-copy application to create an ISO image of the rescue CD, and call this ISO image file boot.iso.
2. On PC#3 (Windows XP in this example), put the ISO file in a Windows folder – file boot.iso in folder aaa as shown in the diagram below.
Figure B-2  Windows Browser

3. Right-click the folder `aaa` and select the “sharing” menu. The default name is the folder name but changed to `share_some_folder` as shown in the diagram below.

Now, the file `boot.iso` can be used from a Spider device. The file can be left there permanently, and when a PC/server crashes and cannot boot, the combination of this file and the Spider device will be used to boot the PC/server.

Figure B-3  Firewall Properties Window

Step 2 – Enable Virtual Media

In this example, PC#2 does not respond, and rebooting does not cure the problem. PC#2 has Spider device#2 attached.

1. On any PC (call this the client PC), bring up a browser, browse to Spider device#2, and log in.
2. Go to the Virtual Media page and complete the fields in the **Image on Windows Share** section of the page as shown in the diagram below.

**Figure B-4 Virtual Media Page**

3. Click **Set**, and see that the **Virtual Media Active Image** section now contains data as shown in the diagram below.
Step 3 – Use the Virtual Media

1. PC#2 shown in the diagram below is a Linux PC.

2. Once Step 1 is done, PC#2 will detect a new USB CD drive connected to its USB as shown in the diagram below. The CD is shown below as **Fedora Core** because that is the volume name of the rescue CD (**boot.iso** is the ISO image of this CD).
3. You should be able to boot from the external USB device (boot.iso) on PC#2. Make sure that you set BIOS to boot from the USB device.

**Note:** Some systems may not support USB boot.
## Appendix C: Supported Resolutions and Refresh Rates

The table below lists the supported resolution and refresh rates for video.

**Table C-1  Supported Video Resolutions and Refresh Rates**

<table>
<thead>
<tr>
<th>Resolution (x,y)</th>
<th>Refresh Rates (Hz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>640x340</td>
<td>70, 85</td>
</tr>
<tr>
<td>640x400</td>
<td>56, 85</td>
</tr>
<tr>
<td>640x480</td>
<td>60, 67, 72, 75, 85</td>
</tr>
<tr>
<td>720x400</td>
<td>70, 85</td>
</tr>
<tr>
<td>800x600</td>
<td>56, 60, 70, 72, 75, 85</td>
</tr>
<tr>
<td>832x624</td>
<td>75</td>
</tr>
<tr>
<td>1024x768</td>
<td>60, 70, 72, 75, 85</td>
</tr>
<tr>
<td>1152x864</td>
<td>75</td>
</tr>
<tr>
<td>1152x870</td>
<td>75</td>
</tr>
<tr>
<td>1152x900</td>
<td>66, 76</td>
</tr>
<tr>
<td>1280x960</td>
<td>60</td>
</tr>
<tr>
<td>1280x1024</td>
<td>60</td>
</tr>
<tr>
<td>1600x1200</td>
<td>60</td>
</tr>
</tbody>
</table>

**Note:** The 1600 x 1200 resolution and 60 Hz refresh rate is supported by the SpiderDuo device without conditions. If a Spider device hardware is revision G22, G23, E21 or higher, it will also support up to 1600 x 1200 at 60 Hz. If the Spider device hardware is an earlier revision, it will only support up to 1280 x 1024 at 60 Hz. The hardware revision number can be located on the Spider device Product Information Label shown in Figure 2-8.
Appendix D: Mounting Bracket Kit

A versatile mounting bracket and screws are supplied to assist in easily installing and mounting a single Spider or SpiderDuo device into a server rack in various orientations (e.g., horizontal or vertical). The kit number is 083-015-R.

![Mounting Bracket and Screws](image)

The kit includes:

- One (1) 4.0" x 1-3/4" x 1/4" bracket
- Two (2) 1/2" long, 10-32 stainless steel Phillips-head screws

Once the mounting bracket is installed in the rack, the Spider or SpiderDuo device can be easily and securely attached to the elevated mounting posts and easily removed if necessary.

To install the mounting bracket and Spider device into a server rack, perform the following steps.

1. Mount the bracket with a Phillips screwdriver.

![Attaching the Mounting Bracket](image)

2. Attach the Spider or SpiderDuo device to the bracket mounting posts.
Figure D-3 Attaching the Device to the Mounting Bracket

3. Connect the cables and the Spider or SpiderDuo device is ready to use!

Figure D-4 Connecting the Cables

Table D-5 Lantronix Part Number

<thead>
<tr>
<th>Lantronix Part Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>083-015-R</td>
<td>Mounting Bracket Kit for Spider device</td>
</tr>
</tbody>
</table>

The bracket kit is included in the box with the Spider or SpiderDuo device that ship with v2.0 firmware and later. For earlier shipments, the mounting kit is sold separately. For additional information contact Lantronix Sales at 800-422-7055, or for technical questions contact Lantronix Technical Support at [http://www.lantronix.com/support](http://www.lantronix.com/support).
Appendix E: PCU Safety Information

Please follow the safety precautions described below when installing and operating the PCU.

Cover

◆ Do not remove the cover of the PCU. There are no user-serviceable parts inside. Opening or removing the cover may expose you to dangerous voltage that could cause fire or electric shock.
◆ Refer all servicing to Lantronix.

Power Plug

◆ When disconnecting the power cable from the socket, pull on the plug, not the cord.
◆ Always connect the power cord to a properly wired and grounded power source. Do not use adapter plugs or remove the grounding prong from the cord.
◆ Only use a power cord with a voltage and current rating greater than the voltage and current rating marked on the unit.
◆ Install the unit near an AC outlet that is easily accessible.
◆ Always connect any equipment used with the product to properly wired and grounded power sources.
◆ To help protect the product from sudden, transient increases and decreases in electrical power, use a surge suppressor, line conditioner, or uninterruptible power supply (UPS) connected between the AC power source and PCU.
◆ Do not connect or disconnect this product during an electrical storm.

Input Supply

◆ Check nameplate ratings to assure there is no overloading of supply circuits that could affect overcurrent protection and supply wiring.

Warning: To avoid electrical shock always disconnect the AC power cords to the PCU before servicing.

Grounding

◆ Maintain reliable grounding of this product.
◆ Pay particular attention to supply connections when connecting to power strips, rather than directly to the branch circuit.

Fuses

For protection against fire, replace the power-input-module fuse with the same type and rating.
Appendix F: Technical Support

If you are unable to resolve an issue using the information in this documentation, contact the following resources.

Technical Support US
Check our online knowledge base or send a question to Technical Support at http://www.lantronix.com/support.
Phone: (800) 422-7044
(949) 453-7198

Technical Support Europe, Middle East, Africa
Phone: +33 1 39 30 41 72
Email: eu_techsupp@lantronix.com or eu_support@lantronix.com

Firmware downloads, FAQs, and the most up-to-date documentation are available at http://www.lantronix.com/support.

When you report a problem, please provide the following information:
- Your name, and your company name, address, and phone number
- Lantronix model number
- Lantronix serial number
- Firmware version
- Description of the problem
- Target computer interface (PS/2 or USB) and video format
- Status of the unit when the problem occurred (please try to include information on user and network activity at the time of the problem)
Appendix G: Compliance

The following meet the ISO/IEC Guide 17050-1, 17050-2 and EN 45014 compliances.

Manufacturer Name & Address
Lantronix, Inc.
167 Technology, Irvine, CA 92618 USA
Declares that the following product:

Product Name: Lantronix® Spider™

Conforms to the following standards or other normative documents:

- UL/CUL (CSA-22.2 No. 60950-1-03 / UL-60950-1)
- CE - IEC 60950-1
- C-Tick
- FCC Part 15, Equipment Class A
- VCCI V-3/2006.04 Class A
- AS/NZS CISPR 22: 2006 Class A
- EN61000-3-2: 2000 +A2: 2005 Class A
- Pb-free components

Warning: This is a class A product. In a domestic environment this product may cause radio interference in which case the user may be required to take adequate measures.
RoHS Notice

All Lantronix products in the following families are China RoHS-compliant and free of the following hazardous substances and elements:
